

## INTRODUCTION

KS0075 is a dot matrix LCD driver & controller LSI which is fabricated by low power CMOS technology. It can display 1, 2, or 4 lines with 5 x 8 or 6 x 8 dots format.

## FUNCTIONS

- Character type dot matrix LCD driver & controller
- Internal driver : 34 common and 100 segment signal output
- Easy interface with 4-bit or 8-bit MPU
- Clock synchronized serial Interface
- 5 x 8 dot matrix possible
- 6 x 8 dot matrix possible
- Bi-directional shift function
- All character reverse display
- Display shift per line
- Voltage converter for LCD drive voltage : 13 V max (2 times / 3 times)
- Various instruction functions
- Automatic power on reset

## FEATURES

- Internal Memory
  - Character Generator ROM (CGROM) : 9,600 bits (240 characters x 5 x 8 dot)
  - Character Generator RAM (CGRAM) : 64 x 8 bits (8 characters x 5 x 8 dot)
  - Segment Icon RAM (SEGRAM) : 16 x 8 bits (96 icons max.)
  - Display Data RAM (DDRAM) : 80 x 8 bits (80 characters max.)
- Low power operation
  - Power supply voltage range : 2.7 ~ 5.5 V (VDD)
  - LCD Drive voltage range : 3.0 ~ 13.0 V (VDD - V5)
- CMOS process
- Programmable duty cycle : 1/17, 1/33 (refer to Table 1.)
- Internal oscillator with an external resistor
- Bare chip available

Table 1. Programmable duty cycles

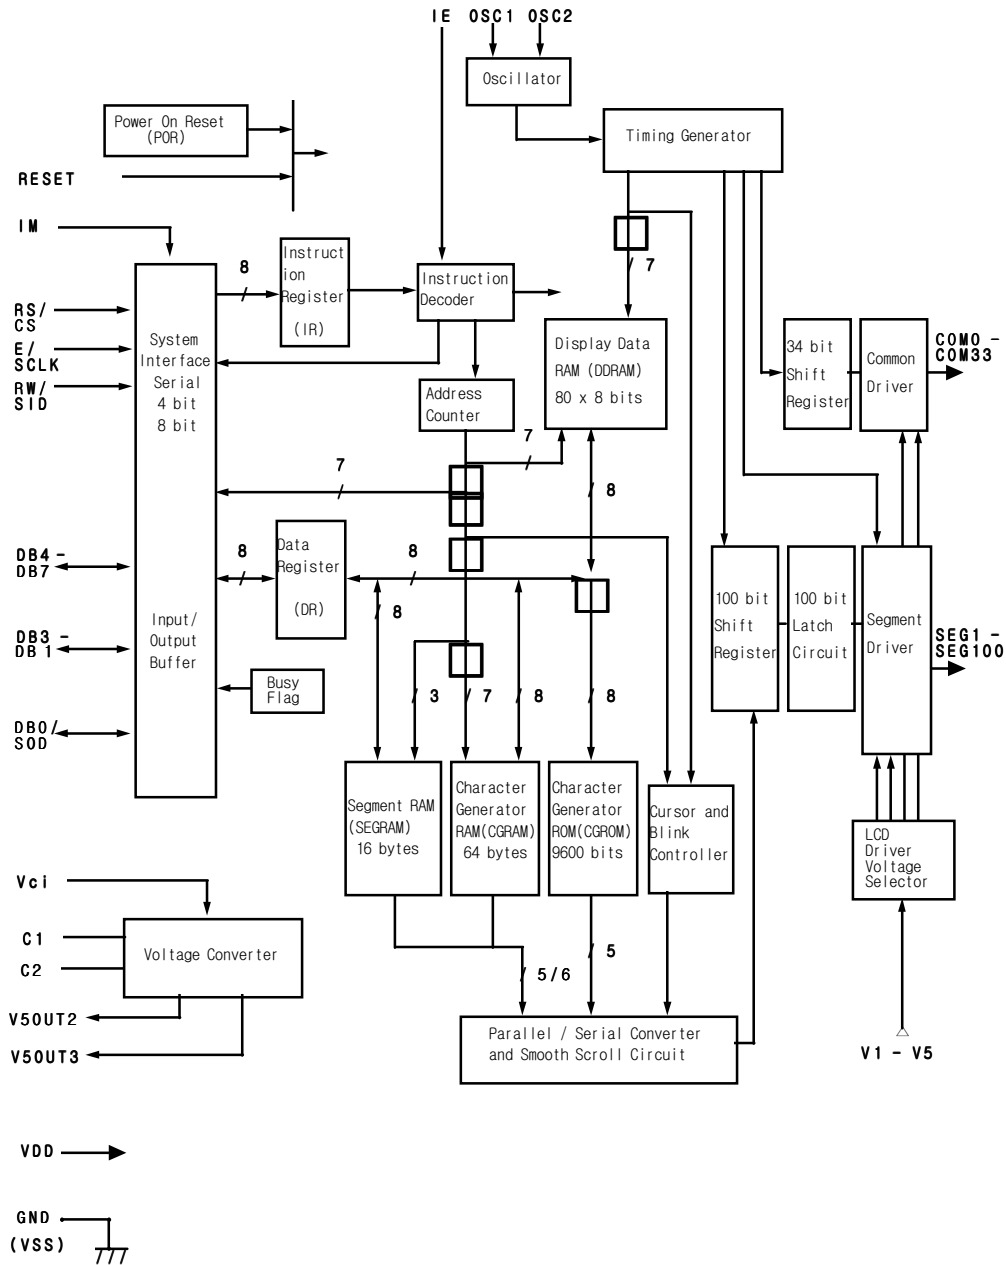

## 5-dot font width

Display Line Numbers	Duty Ratio	Single-chip Operation	
		Displayable characters	Possible icons
1	1/17	1 line of 40 characters	80
2	1/33	2 lines of 40 characters	80
4	1/33	4 line of 20 characters	80

## 6-dot font width

Display Line Numbers	Duty Ratio	Single-chip Operation	
		Displayable characters	Possible icons
1	1/17	1 line of 32 characters	96
2	1/33	2 lines of 32 characters	96
4	1/33	4 line of 16 characters	96

## PAD DESCRIPTION

PAD (NO)	INPUT/ OUTPUT	NAME	DESCRIPTION	INTERFACE
VDD (51)	-	Power supply	for logical circuit(+3V,+5V)	Power supply
VSS1,VSS2 (57,72)			0V(GND)	
V1 ~ V5 (79 ~ 75)			Bias voltage level for LCD driving.	
Vci (69)			Input voltage to the voltage converter to generate LCD drive voltage(Vci = 1.0-4.5V).	
SEG1 ~ SEG100 (97-163, 1-33)	Output	Segment output	Segment signal output for LCD drive.	LCD
COM0 ~ COM33 (80 ~ 96, 34 ~ 50)	Output	Common output	Common signal output for LCD drive.	LCD
OSC1,OSC2 (53,52)	Input (OSC1), Output (OSC2)	Oscillator	When use internal oscillator, connect external Rf resistor. If external clock is used, connect it to OSC1.	External resistor/oscillator (OSC1)
C1,C2 (71,70)	Input	External capacitance input	To use the voltage converter(2 times /3 times), these pins must be connected to the external capacitance.	External capacitance
RESET (54)	Input	Reset pin	Initialized to Low	-
IE (56)	Input	Select pin of instruction set	When IE = "High", Instruction set is selected as Table 6. When IE = "Low", Instruction set is selected as Table 10.	-
V5OUT2(73)	Output	Two times converter output	The value of Vci is converted two times. To use three times converter, the same capacitance as that of C1-C2 should be connected here.	V5 capacitance
V5OUT3(74)		Three times converter output	The value of Vci is converted three times.	V5

## PAD DESCRIPTION (continued)

PAD (NO)	INPUT/ OUTPUT	NAME	DESCRIPTION	INTERFACE
IM (55)	Input	Interface mode selection	Select Interface mode with the MPU. When IM = "Low" : Serial mode, When IM = "High" : 4-bit/8-bit bus mode.	-
RS/CS (58)	Input	Register select/ Chip select	In bus mode, used as register selection input. When RS/CS = "High", Data register is selected. When RS/CS = "Low", Instruction register is selected.  In serial mode, used as chip selection input. When RS/CS = "Low", selected. When RS/CS = "High", not selected.(Low access enable)	MPU
RW/SID (59)	Input	Read - write/Serial input data	In bus mode, used as read/write selection input. When RW/SID = "High", read operation. When RW/SID = "Low", write operation. In serial mode, used for data input pin.	MPU
E/SCLK (60)	Input	Read -write enable/Serial clock	In bus mode, used as read -write enable signal. In serial mode, used as serial clock input pin.	MPU
DB0/SOD (61)	Input - Output/Output	Data bus 0 bit/Serial output data	In 8-bit bus mode, used as lowest bi-directional data bit. During 4-bit bus mode, Open this pin. In serial mode, used as serial data output pin. If not in read operation, open this pin.	MPU
DB1 ~ DB3 (62 ~ 64)	Input. Output	Data bus 1 ~ 7	In 8-bit bus mode, used as low order bi- directional data bus. During 4-bit bus mode or serial mode, open these pins.	MPU
DB4 ~ DB7 (65 ~ 68)			In 8-bit bus mode, used as high order bi- directional data bus. In case of 4-bit bus mode, used as both high and low order. DB7 used for Busy Flag output. During serial mode, open these pins.	MPU

## FUNCTION DESCRIPTION

### System Interface

This chip has all three kinds interface type with MPU : serial, 4-bit bus and 8-bit bus. Serial and bus(4-bit/8-bit) is selected by IM input, and 4-bit bus and 8-bit bus is selected by DL bit in the instruction register.

During read or write operation, two 8-bit registers are used. one is data register (DR), the other is instruction register(IR).

The data register(DR) is used as temporary data storage place for being written into or read from DDRAM/CGRAM/SEGRAM, target RAM is selected by RAM address setting instruction. Each internal operation, reading from or writing into RAM, is done automatically.

Hence, after MPU reads DR data, the data in the next DDRAM/CGRAM/SEGRAM address is transferred into DR automatically. Also after MPU writes data to DR, the data in DR is transferred into DDRAM/CGRAM/SEGRAM automatically.

The Instruction register(IR) is used only to store instruction code transferred from MPU. MPU cannot use it to read instruction data.

To select register, use RS/CS input pin in 4-bit/8-bit bus mode(IM = "High") or RS bit in serial mode(IM = "Low").

Table 2. Various kinds of operations according to RS and R/W bits.

RS	R/W	Operation
0	0	Instruction Write operation (MPU writes Instruction code into IR)
0	1	Read Busy flag(DB7) and address counter (DB0 ~ DB6)
1	0	Data Write operation (MPU writes data into DR)
1	1	Data Read operation (MPU reads data from DR)

### Busy Flag (BF)

When BF = "High", it indicates that the internal operation is being processed. So during this time the next instruction cannot be accepted. BF can be read, when RS = Low and R/W = High(Read Instruction Operation), through DB7 port . Before executing the next instruction, be sure that BF is not High.

Display Data RAM (DDRAM)

DDRAM stores display data of maximum 80 x 8 bits (80 characters).  
 DDRAM address is set in the address counter (AC) as a hexadecimal number. (refer to Fig-1.)

Fig-1. DDRAM Address

1) Display of 5-dot font width character

① 5-dot 1 line display

In the case of 1 line display with 5-dot font, the address range of DDRAM is 00H ~ 4FH.  
 (Refer to Fig-2)

Fig-2. 1-line X 40ch. display

② 5-dot 2 line display

In the case of 2 line display with 5-dot font, the address range of DDRAM is 00H ~ 27H, 40H ~ 67H. (Refer to Fig-3)

Fig-3. 2-line X 40ch. display (5-dot font width)

③ 5-dot 4 line display

In the case of 4 line display with 5-dot font, the address range of DDARM is 00H ~ 13H, 20H ~ 33H, 40H ~ 53H, 60H ~ 73H. (Refer to Fig-4)

Fig-4. 4-line X 20ch.

display (5-dot font width)

2) Display of 6-dot font width character

When this device is used in 6-dot font width mode, SEG97,SEG98,SEG99 and SEG100 must be open.

① 6-dot 1 line display

In the case of 1 line display with 6-dot font, the address range of DDRAM is 00H ~ 4FH.  
(Refer to Fig-5)

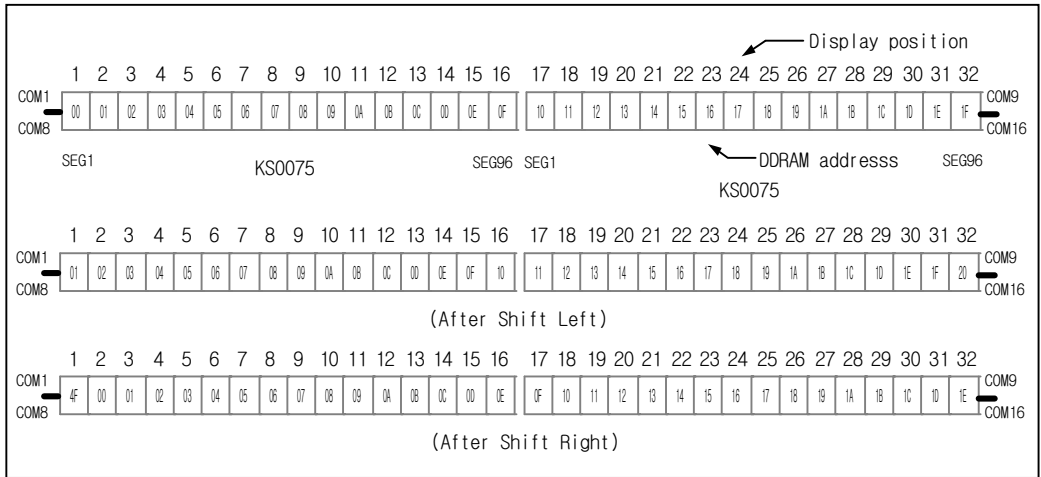

Fig-5. 1-line X 32ch. display

② 6-dot 2 line display

In the case of 2 line display with 6-dot font, the address range of DDRAM is 00H ~ 27H, 40H ~ 67H. (refer to Fig-6)

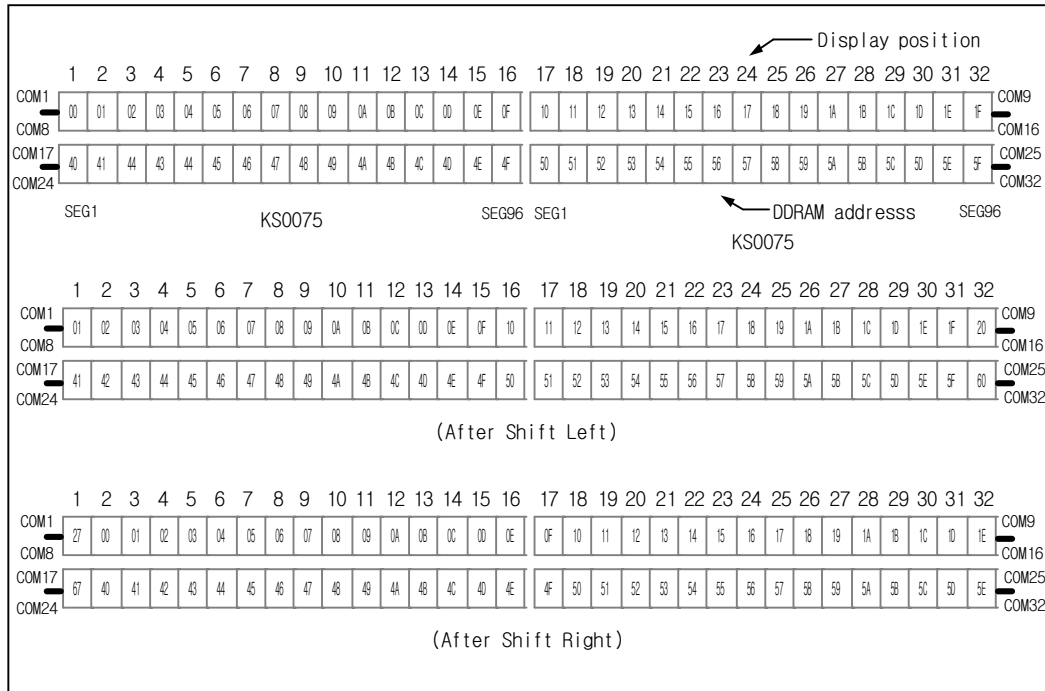

Fig-6. 2-line X 32ch. display (6-dot font width)

**Timing Generation Circuit**

Timing generation circuit generates clock signals for the internal operations.

**Address Counter (AC)**

Address Counter(AC) stores DDRAM/CGRAM/SEGRAM address, transferred from IR.  
After writing into (reading from) DDRAM/CGRAM/SEGRAM, AC is automatically increased (decreased) by 1.  
When RS = "Low" and R/W = "High", AC can be read through DB0 ~ DB6 ports

**Cursor/Blink Control Circuit**

It controls cursor/blink ON/OFF and black/white inversion at cursor position.

**LCD Driver Circuit**

LCD Driver circuit has 34 common and 100 segment signals for LCD driving.  
Data from SEGRAM/CGRAM/CGROM is transferred to 100-bit segment latch serially, which is stored to 100-bit shift latch.  
When each common is selected by 34-bit common register, segment data also output through segment driver from 100-bit segment latch.  
In 1-line display mode, COM0 ~ COM17 have 1/17 duty, and in 2-line or 4-line mode, COM0-COM33 have 1/33 duty ratio.

CGROM (Character Generator ROM)

CGROM has 5 X 8-dot 240 character pattern. (refer to Table 3)  
Table 3. CGROM Character Code Table

CGRAM (Character Generator RAM)

CGRAM has up to 5 X 8-dot 8 characters. By writing font data to CGRAM, user defined character can be used.  
(Refer to Table 4)

Table 4. Relationship between Character Code(DDRAM) and Character Pattern(CGRAM)

1) 5x8 dot Character pattern

Character Code(DDRAM data)								CGRAM address						CGRAM data								Pattern number
D7	D6	D5	D4	D3	D2	D1	D0	A5	A4	A3	A2	A1	A0	P7	P6	P5	P4	P3	P2	P1	P0

			⋮						⋮		1	1	0				□	0	0	0	□	
			⋮						⋮		1	1	1				0	0	0	0	0	

2) 6x8 dot Character pattern

Character Code(DDRAM data)								CGRAM address						CGRAM data								Pattern number
D7	D6	D5	D4	D3	D2	D1	D0	A5	A4	A3	A2	A1	A0	P7	P6	P5	P4	P3	P2	P1	P0	
0	0	0	0	X	0	0	0	0	0	0	0	0	0	B1	B0	0	0	□	□	□	0	pattern 1
				⋮							0	0	1			0	□	0	0	0	□	
				⋮							0	1	0			0	□	0	0	0	□	
				⋮							0	1	1			0	□	□	□	□	□	
				⋮							1	0	0			0	□	0	0	0	□	
				⋮							1	0	1			0	□	0	0	0	□	
				⋮							1	1	0			0	□	0	0	0	□	
				⋮							1	1	1			0	0	0	0	0	0	
				:							:					:					:	
0	0	0	0	X	1	1	1	1	1	1	0	0	0	B1	B0	0	□	0	0	0	□	pattern 8
				⋮							0	0	1			0	□	0	0	0	□	
				⋮							0	1	0			0	□	0	0	0	□	
				⋮							0	1	1			0	□	□	□	□	□	
				⋮							1	0	0			0	□	0	0	0	□	
				⋮							1	0	1			0	□	0	0	0	□	
				⋮							1	1	0			0	□	0	0	0	□	
				⋮							1	1	1			0	0	0	0	0	0	

In displaying 5-dot font width, when B1 = "1", enabled dots of P0 ~ P4 will blink, and when B1 = "0" and B0 = "1", enabled dots in P4 will blink, when B1 = "0" and B0 = "0", blink will not happen.

In displaying 6-dot font width, when B1 = "1", enabled dots of P0 ~ P5 will blink, and when B1 = "0" and B0 = "1", enabled dots of P5 will blink, when B1 = "0" and B0 = "0", blink will not happen.

2. "X" : Don't care

## SEGRAM (Segment Icon RAM)

SEGRAM has segment control data and segment pattern data. During 1-line display mode, COM0(COM17) makes the data of SEGRAM enable to display icons. When used in 2/4-line display mode COM0(COM33) does that. Its higher 2-bits are blinking control data, and lower 6-bits are pattern data. (refer to Table 5 and Fig-8)

Table 5. Relationship between SEGRAM address and display pattern

SEGRAM address				SEGRAM data display pattern															
				5-dot font width								6-dot font width

2. S1~S80 : Icon pattern ON/OFF in 5-dot font width

S1~S96 : Icon pattern ON/OFF in 6-dot font width

3. "X" : Don't care

Fig-8. Relationship between SEGRAM and segment display

## INSTRUCTION DESCRIPTION

### OUTLINE

To overcome the speed difference between internal clock of KS0075 and MPU clock, KS0075 performs internal operation by storing control information to IR or DR. The internal operation is determined according to the signal from MPU, composed of read/write and data bus. (refer to Table 6/10)

Instruction can be divided largely four kinds,

- (1) KS0075 function set instructions ( set display methods, set data length, etc.)
- (2) address set instructions to internal RAM
- (3) data transfer instructions with internal RAM
- (4) others .

The address of internal RAM is automatically increased or decreased by 1.

When IE = "High", KS0075 is operated according to Instruction Set 1 (Table 6) and when IE = "Low", KS0075 is operated according to Instruction Set 2 (Table 10).

\* Note : During internal operation, Busy Flag (DB7) is read High. Busy Flag check must precede the next instruction.

When an MPU program with Busy Flag (DB7) checking is made,  $1/2 f_{osc}$  (is necessary) for executing the next instruction by the falling edge of the "E" signal after the Busy Flag (DB7) goes to "Low".

## (1) INSTRUCTION DESCRIPTION 1 (IE = "High")

Table 6. Instruction Set 1

Instruction	RE	Instruction Code										Description	Execution Time (fosc = 270 kHz)	
		R S	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0			
Clear Display	X	0	0	0	0	0	0	0	0	0	0	1	Write "20H" to DDRAM. and set DDRAM address to "00H" from AC.	1.53ms
Return Home	0	0	0	0	0	0	0	0	0	0	1	X	Set DDRAM address to "00H" from AC and return cursor to its original position if shifted. The contents of DDRAM are not changed.	1.53ms
Power Down Mode	1	0	0	0	0	0	0	0	0	0	1	PD	Set power down mode bit. PD = "1" : power down mode set, PD = "0" : power down mode disable	39μs
Entry Mode Set	0	0	0	0	0	0	0	0	0	1	I/D	S	Assign cursor moving direction. I/D = "1" : increment, I/D = "0" : decrement and display shift enable bit. S = "1" : make display shift of the enabled lines by the DS4 - DS1 bits in the Shift Enable instruction. S = "0" : display shift disable	39 μs
	1	0	0	0	0	0	0	0	0	1	1	BID	Segment bi-direction function. BID = "1" : Seg100 → Seg1, BID = "0" : Seg1 → Seg100.	
Display ON/OFF Control	0	0	0	0	0	0	0	0	1	D	C	B	Set display/cursor/blink on/off D = "1" : display on, D = "0" : display off, C = "1" : cursor on, C = "0" : cursor off, B = "1" : blink on, B = "0" : blink off.	39 μs
Extended function set	1	0	0	0	0	0	0	0	1	FW	B/W	NW	Assign font width, black/white inverting of cursor, and 4-line display mode control bit. FW = "1" : 6-dot font width, FW = "0" : 5-dot font width, B/W = "1" : black/white inverting of cursor enable, B/W = "0" : black/white inverting of cursor disable NW = "1" : 4-line display mode, NW = "0" : 1-line or 2-line display mode.	39 μs

(Table 6. continued)

Instruction	RE		Instruction Code										Description	Execution Time (fosc = 270 kHz)
	R	S	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0			
Cursor or Display Shift	0	0	0	0	0	0	1	S/C	R/L	X	X	Cursor or display shift. S/C = "1" : display shift, S/C = "0" : cursor shift, R/L = "1" : shift to right, R/L = "0" : shift to left.	39 μs	
Shift Enable	1	0	0	0	0	0	1	DS4	DS3	DS2	DS1	(when DH = "1") Determine the line for display shift . DS1 = "1/0" : 1st line display shift enable/disable DS2 = "1/0" : 2nd line display shift enable/disable DS3 = "1/0" : 3rd line display shift enable/disable DS4 = "1/0" : 4th line display shift enable/disable.	39 μs	
Scroll Enable	1	0	0	0	0	0	1	HS4	HS3	HS2	HS1	(when DH = "0") Determine the line for horizontal smooth scroll. HS1 = "1/0" : 1st line dot scroll enable/disable HS2 = "1/0" : 2nd line dot scroll enable/disable HS3 = "1/0" : 3rd line dot scroll enable/disable HS4 = "1/0" : 4th line dot scroll enable/disable.	39 μs	
Function Set	0	0	0	0	0	1	DL	N	RE(0)	DH	REV	Set interface data length (DL = "1" : 8-bit, DL = "0" : 4-bit), numbers of display line when NW = "0", (N = "1" : 2-line, N = "0" : 1-line), extension register, RE("0"), shift/scroll enable DH = "1" : display shift enable DH = "0" : dot scroll enable. reverse bit REV = "1" : reverse display, REV = "0" : normal display.	39 μs	
	1	0	0	0	0	1	DL	N	RE(1)	BE	0	Set DL, N, RE("1") and CGRAM/SEGRAM blink enable (BE) BE = "1/0" : CGRAM/SEGRAM blink enable/disable	39 μs	

(Table 6. continued)

Instruction	RE	Instruction Code										Description	Execution Time (fosc = 270 kHz)
		R S	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0		
Set CGRAM Address	0	0	0	0	1	AC5	AC4	AC3	AC2	AC1	AC0	Set CGRAM address in address counter.	39 $\mu$ s
Set SEGRAM Address	1	0	0	0	1	X	X	AC3	AC2	AC1	AC0	Set SEGRAM address in address counter.	39 $\mu$ s
Set DDRAM Address	0	0	0	1	AC6	AC5	AC4	AC3	AC2	AC1	AC0	Set DDRAM address in address counter.	39 $\mu$ s
Set Scroll Quantity	1	0	0	1	X	SQ5	SQ4	SQ3	SQ2	SQ1	SQ0	Set the quantity of horizontal dot scroll.	39 $\mu$ s
Read Busy flag and Address	X	0	1	BF	AC6	AC5	AC4	AC3	AC2	AC1	AC0	Can be known whether during internal operation or not by reading BF. The contents of address counter can also be read. BF = "1" : busy state, BF = "0" : ready state.	0 $\mu$ s
Write Data	X	1	0	D7	D6	D5	D4	D3	D2	D1	D0	Write data into internal RAM (DDRAM / CGRAM / SEGRAM).	43 $\mu$ s
Read Data	X	1	1	D7	D6	D5	D4	D3	D2	D1	D0	Read data from internal RAM (DDRAM / CGRAM / SEGRAM).	43 $\mu$ s

- \* Note : 1. When an MPU program with Busy Flag(DB7) checking is made, 1/2 fosc (is necessary) for executing the next instruction by the "E" signal after the Busy Flag (DB7) goes to "Low".  
2. "X" : Don't care

## 1) Display Clear

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	0	0	0	0	0	1

Clear all the display data by writing "20H" (space code) to all DDRAM address, and set DDRAM address to "00H" into AC (address counter). Return cursor to the original status, hence, bring the cursor to the left edge on first line of the display. Make entry mode increment (I/D = "1").

## 2) Return Home : (RE = 0)

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	0	0	0	0	1	X

Return Home is cursor return home instruction.  
Set DDRAM address to "00H" into the address counter.  
Return cursor to its original site and return display to its original status, if shifted.  
Contents of DDRAM does not change.

## 3) Power Down Mode Set : (RE = 1)

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
1	0	0	0	0	0	0	0	1	PD

Power down mode enable bit set instruction.  
PD = "High", it makes KS0075 suppress current consumption except the current needed for data storage by executing next three functions.  
1. make the output value of all the COM/SEG ports VDD  
2. make the COM/SEG output value of extension driver VDD by setting D output to "High" and M output to "Low"  
3. disable voltage converter to remove the current through the divide resistor of power supply.  
This instruction can be used as power sleep mode.  
When PD = "Low", power down mode becomes disabled.

## 4) Entry Mode Set

## ① (RE = 0)

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	0	0	0	1	I/D	S

Set the moving direction of cursor and display.

I/D : Increment / decrement of DDRAM address (cursor or blink)

When I/D = "High", cursor/blink moves to right and DDRAM address is increased by 1.

When I/D = "Low", cursor/blink moves to left and DDRAM address is decreased by 1.

\* CGRAM/SEGRAM operates the same as DDRAM, when read from or write to CGRAM/SEGRAM.

When S = "High", after DDRAM write, the display of enabled line by DS1 - DS4 bits

in the Shift Enable instruction is shifted to the right (I/D = "0") or to the left (I/D = "1").

But it will seem as if the cursor does not move.

When S = "Low", or DDRAM read, or CGRAM/SEGRAM read/write operation, shift of display like this function is not performed.

## ② (RE = 1)

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	0	0	0	1	1	BID

Set the data shift direction of segment in the application set.

BID : Data Shift Direction of Segment

When BID = "Low", segment data shift direction is set to normal order from SEG1 to SEG100.

When BID = "High", segment data shift direction is set to reverse from SEG100 to SEG1.

By using this instruction, the efficiency of application board area can be raised.

\* The BID setting instruction is recommended to be set at the same time level of function set instruction.

\* DB1 bit must be set to "1".

## 5) Display ON/OFF Control ( RE = 0 )

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	0	0	1	D	C	B

Control display/cursor/blink ON/OFF 1 bit register.

D : Display ON/OFF control bit

When D = "High", entire display is turned on.

When D = "Low", display is turned off, but display data is remained in DDRAM.

C : Cursor ON/OFF control bit

When C = "High", cursor is turned on.

When C = "Low", cursor is disappeared in current display, but I/D register remains its data.

B : Cursor Blink ON/OFF control bit

When B = "High", cursor blink is on, that performs alternate between all the high data and display character at the cursor position. If fosc has 270 kHz frequency, blinking has 370 ms interval.

When B = "Low", blink is off.

## 6) Extended Function Set ( RE = 1 )

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	0	0	1	FW	B/W	NW

FW : Font Width control

When FW = "High", display character font width is assigned to 6-dot and execution time becomes 6/5 times than that of 5-dot font width.

The user font, specified in CGRAM, is displayed into 6-dot font width, bit-5 to bit-0, including the leftmost space bit of CGRAM. (refer to Fig-9)

When FW = "Low", 5-dot font width is set.

B/W : Black/White Inversion enable bit

When B/W = "High", black/white inversion at the cursor position is set. In this case C/B bit of display ON/OFF control instruction becomes don't care condition. If fosc has frequency of 270 kHz, inversion has 370 ms intervals.

NW : 4 Line mode enable bit

When NW = "High", 4 line display mode is set. In this case N bit of function set instruction becomes don't care condition.

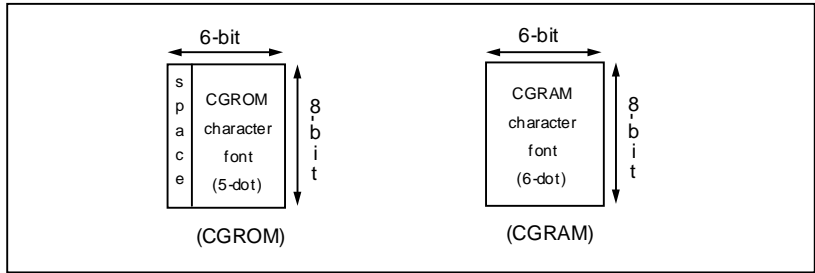

Fig-9. 6-dot font width CGROM/CGRAM

7) Cursor or Display Shift (RE = 0)

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	0	1	S/C	R/L	-	-

Shift right/left cursor position or display, with out writing or reading of display data, This instruction is used to correct or search display data.(refer to Table 7)  
 During 2-line mode display, cursor moves to the 2nd line after 40th digit of 1st line.  
 In 4-line mode, cursor moves to the next line, only after every 20th digit of the current line.  
 Note that display shift is performed simultaneously in all the line enabled by DS1 - DS4 in the Shift Enable instruction.  
 When displayed data is shifted repeatedly, each line shifted individually.  
 When display shift is performed, the contents of address counter are not changed.  
 During low power consumption mode, display shift may not be performed normally.

Table 7. Shift patterns according to S/C and R/L bits

S/C	R/L	Operation
0	0	Shift cursor to the left, ADDRESS COUNTER is decreased by 1
0	1	Shift cursor to the right, ADDRESS COUNTER is increased by 1
1	0	Shift all the display to the left, cursor moves according to the display
1	1	Shift all the display to the right, cursor moves according to the display

8) Shift/Scroll Enable (RE = 1)

① (DH = 0)

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	0	1	HS4	HS3	HS2	HS1

HS : Horizontal Scroll per Line Enable

This instruction makes valid dot shift by a display line unit.

HS1, HS2, HS3 and HS4 indicate each line to be dot scrolled, and each scroll is performed individually in each line.

If the line in 1-line display mode or the 1st line in 2-line display mode, is to be scrolled set HS1 and HS2 to "High".

If the 2nd line scroll is needed in 2-line mode, set HS3 and HS4 to "High". (refer to Table 8)

② (DH = 1)

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	0	1	DS4	DS3	DS2	DS1

DS : Display Shift per Line Enable

This instruction selects shifting line to be shifted according to each line mode in display shift right/left instruction.

DS1, DS2, DS3 and DS4 indicate each line to be shifted, and each shift is performed individually in each line.

If DS1 and DS2 is set to "High" (enable) in 2 line mode, only the 1st line is shifted

and the 2nd line is not shifted. When only DS1 = "High", only the half of the 1st line is shifted. If all the DS bits (DS1 to DS4) are set to "Low" (disable), no display is shifted.

Table 8. Relationship between DS and COM signal

Enable bit	Enabled common signals during shift	Description
HS1/DS1	COM1 ~ COM8	The part of display line that corresponds to enabled common signal can be shifted.
HS2/DS2	COM9 ~ COM16	
HS3/DS3	COM17 ~ COM24	
HS4/DS4	COM25 ~ COM32	

## 9) Function Set

① (RE = 0)

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	1	DL	N	RE (0)	DH	REV

**DL : Interface data length control bit**

When DL = "High", it means 8-bit bus mode with MPU.

When DL = "Low", it means 4-bit bus mode with MPU. Hence, DL is a signal to select 8-bit or 4-bit bus mode.

In 4-bit bus mode, it is required to transfer 4-bit data twice.

**N : Display line number control bit**

It is variable only when NW bit of extended function set instruction is Low.

When N = "Low", it means 1-line display mode.

When N = "High", 2-line display mode is set.

When NW = "High", N bit is invalid, it means 4-line mode independent of N bit.

**RE : Extended function registers enable bit**

At this instruction, RE must be "Low".

**DH : Display shift enable selection bit.**

When DH = "High", enable display shift per line.

When DH = "Low", enable smooth dot scroll.

This bit can be accessed only when IE pin input is "High".

**REV : Reverse enable bit**

When REV = "High", all the display data are reversed. I.e., all the white dots become black and black dots become white.

When REV = "Low", the display mode set normal display.

② (RE = 1)

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	1	DL	N	RE (1)	BE	0

DL : Interface data length control bit

When DL = "High", it means 8-bit bus mode with MPU.

When DL = "Low", it means 4-bit bus mode with MPU. Hence, DL is a signal to select 8-bit or 4-bit bus mode.

When 4-bit bus mode, it is required to transfer 4-bit data twice.

N : Display line number control bit

It is variable only when NW bit of extended function set instruction is Low.

When N = "Low", 1-line display mode is set.

When N = "High", 2-line display mode is set.

When NW = "High", N bit is invalid, it means 4-line mode independent of N bit.

RE : Extended function registers enable bit

When RE = "High", extended function set registers, SEGRAM address set registers, BID bit, HS/DS bits of shift/scroll enable instruction and BE bits of function set register can be accessed.

BE : CGRAM/SEGRAM data blink enable bit

BE = "High", makes user font of CGRAM and segment of SEGRAM blinking. The quantity of blink is assigned the highest 2 bit of CGRAM/SEGRAM.

10) Set CGRAM Address (RE = 0)

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	1	AC5	AC4	AC3	AC2	AC1	AC0

Set CGRAM address to AC.

This instruction makes CGRAM data available from MPU.

11) Set SEGRAM Address (RE = 1)

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	1	-	-	AC3	AC2	AC1	AC0

Set CGRAM address to AC.

This instruction makes CGRAM data available from MPU.

## 12) Set DDRAM Address (RE = 0)

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	AC6	AC5	AC4	AC3	AC2	AC1	AC0

Set DDRAM address to AC.

This instruction makes DDRAM data available from MPU.

In 1-line display mode (N = 0, NW = 0), DDRAM address is from "00H" to "4FH".

In 2-line display mode (N = 1, NW = 0), DDRAM address in the 1st line is from "00H" to "27H", and DDRAM address in the 2nd line is from "40H" to "67H".

In 4-line display mode (NW = 1), DDRAM address is from "00H" to "13H" in the 1st line, from "20H" to "33H" in the 2nd line, from "40H" to "53H" in the 3rd line and from "60H" to "73H" in the 4th line.

## 13) Set Scroll Quantity (RE = 1)

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	X	SQ5	SQ4	SQ3	SQ2	SQ1	SQ0

Setting SQ5 to SQ0, horizontal scroll quantity can be controlled in dot units. (Refer to Table 9)  
In this case of KS0075 can show hidden areas of DDRAM by executing smooth scroll from 1 to 48 dots.

Table 9. Scroll quantity according to HDS bits

SQ5	SQ4	SQ3	SQ2	SQ1	SQ0	Function
0	0	0	0	0	0	No shift
0	0	0	0	0	1	shift left by 1-dot
0	0	0	0	1	0	shift left by 2-dot
0	0	0	0	1	1	shift left by 3-dot
:	:	:	:	:	:	:
1	0	1	1	1	1	shift left by 47-dot
1	1	X	X	X	X	shift left by 48-dot

## 14) Read Busy Flag &amp; Address

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	1	BF	AC6	AC5	AC4	AC3	AC2	AC1	AC0

This instruction shows whether KS0075 is in internal operation or not. If the resultant BF is High, the internal operation is in progress and you have to wait until BF to be Low, which by then the next instruction can be performed. In this instruction the value of address counter can also be read.

## 15) Write data to RAM

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
1	0	D7	D6	D5	D4	D3	D2	D1	D0

Write binary 8-bit data to DDRAM/CGRAM/SEGRAM.

The selection of RAM from DDRAM, CGRAM, or SEGRAM, is set by the previous address set instruction : DDRAM address set, CGRAM address set, SEGRAM address set.

RAM set instruction can also determines the AC direction to RAM.

After write operation, the address is automatically increased/decreased by 1, according to the entry mode.

## 16) Read data from RAM

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
1	1	D7	D6	D5	D4	D3	D2	D1	D0

Read binary 8-bit data from DDRAM/CGRAM/SEGRAM.

The selection of RAM is set by the previous address set instruction. If address set instruction of RAM is not performed before this instruction, the data that read first is invalid, as the direction of AC is not determined. If RAM data is read several times without RAM address set instruction before read operation, the correct RAM data can be obtained from the second, but the first data would be incorrect, as there is no time margin to transfer RAM data. In DDRAM read operation, cursor shift instruction plays the same role as DDRAM address set instruction : it also transfer RAM data to output data register. After read operation address counter is automatically increased/decreased by 1 according to the entry mode. After CGRAM/SEGRAM read operation, display shift may not be executed correctly.

In case of RAM write operation, AC is increased/decreased by 1 as in read operation after this. In this time, AC indicates the next address position, but the previous data can only be read by read instruction.

## (2) INSTRUCTION DESCRIPTION 2 (IE = "LOW")

Table 10. Instruction Set 2

Instruction	RE	Instruction Code										Description	Execution Time (fosc = 270 kHz)	
		R S	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0			
Clear Display	X	0	0	0	0	0	0	0	0	0	0	1	Write "20H" to DDRAM. and set DDRAM address to "00H" from AC.	1.53ms
Return Home	X	0	0	0	0	0	0	0	0	0	1	X	Set DDRAM address to "00H" from AC and return cursor to its original position if shifted. The contents of DDRAM are not changed.	1.53ms
Entry Mode Set	X	0	0	0	0	0	0	0	0	1	I/D	S	Assign cursor moving direction. I/D = "1" : increment, I/D = "0" : decrement. and display shift enable bit. S = "1" :make entire display shift of all lines during DDRAM write, S = "0":display shift disable	39μs
Display ON/OFF Control	0	0	0	0	0	0	0	0	1	D	C	B	Set display/cursor/blink on/off D = "1" : display on, D = "0" : display off, C = "1" : cursor on, C = "0" : cursor off, B = "1" : blink on, B = "0" : blink off.	39μs
Extended function set	1	0	0	0	0	0	0	0	1	FW	B/W	NW	Assign font width, black/white inverting of cursor, and 4-line display mode control bit. FW = "1" : 6-dot font width, FW = "0" : 5-dot font width, B/W = "1" : black/white inverting of cursor enable, B/W = "0" : black/white inverting of cursor disable NW = "1" : 4-line display mode, NW = "0" : 1-line or 2-line display mode	39μs
Cursor or Display Shift	0	0	0	0	0	0	1	S/C	R/L	X	X	Cursor or display shift. S/C = "1" : display shift, S/C = "0" : cursor shift, R/L = "1" : shift to right, R/L = "0" : shift to left	39μs	

(Table 10. continued)

Instruction	RE		Instruction Code										Description	Execution Time (fosc = 270 kHz)
	R	S	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0			
Scroll Enable	1	0	0	0	0	0	0	1	HS4	HS3	HS2	HS1	Determine the line for horizontal smooth scroll. HS1 = "1/0" : 1st line dot scroll enable/disable HS2 = "1/0" : 2nd line dot scroll enable/disable HS3 = "1/0" : 3rd line dot scroll enable/disable HS4 = "1/0" : 4th line dot scroll enable/disable	39μs

Read Busy flag and Address	X	0	1	BF	AC6	AC5	AC4	AC3	AC2	AC1	AC0		Can be known whether during internal operation or not by reading BF. The contents of address counter can also be read. BF = "1" : busy state, BF = "0" : ready state.	0μs
Write Data	X	1	0	D7	D6	D5	D4	D3	D2	D1	D0		Write data into internal RAM (DDRAM / CGRAM / SEGRAM).	43μs
Read Data	X	1	1	D7	D6	D5	D4	D3	D2	D1	D0		Read data from internal RAM (DDRAM / CGRAM / SEGRAM).	43μs

- \* Note : 1. When an MPU program with Busy Flag(DB7) checking is made, 1/2 fosc (is necessary) for executing the next instruction by the falling edge of the "E" signal after the Busy Flag(DB7) goes to "Low"  
2. "X" : don't care

## 1) Display Clear

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	0	0	0	0	0	1

Clear all the display data by writing "20H" (space code) to all DDRAM address, and set DDRAM address to "00H" into AC (address counter). Return cursor to the original status, hence, bring the cursor to the left edge on first line of the display.  
And entry mode is set to increment mode (I/D = "1").

## 2) Return Home

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	0	0	0	0	1	X

Return Home is cursor return home instruction.  
Set DDRAM address to "00H" into the address counter. Return cursor to its original site and return display to its original status, if shifted.  
Contents of DDRAM does not change.

## 3) Entry Mode Set

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	0	0	0	1	I/D	S

Set the moving direction of cursor and display.

I/D : Increment / decrement of DDRAM address (cursor or blink)

When I/D = "High", cursor/blink moves to right and DDRAM address is increased by 1.

When I/D = "Low", cursor/blink moves to left and DDRAM address is decreased by 1.

\* CGRAM/SEGRAM operates identically to the DDRAM, when reading from or writing to CGRAM/SEGRAM.

When S = "High", after DDRAM write, the entire display of all lines is shifted to the right (I/D = "0") or to the left (I/D = "1"). But it will seem as if the cursor does not moving.

When S = "Low", or DDRAM read, or CGRAM/SEGRAM read/write operation, shift of entire display is not performed.

## 4) Display ON/OFF Control ( RE = 0 )

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	0	0	1	D	C	B

Control display/cursor/blink ON/OFF 1 bit register.

D : Display ON/OFF control bit

When D = "High", entire display is turned on.

When D = "Low", display is turned off, but display data is remained in DDRAM.

C : Cursor ON/OFF control bit

When C = "High", cursor is turned on.

When C = "Low", cursor is disappeared in current display, but I/D register remains its data.

B : Cursor Blink ON/OFF control bit

When B = "High", cursor blink is on, that performs alternate between all the high data and display character at the cursor position. If fosc has 270 kHz frequency, blinking has 370 ms interval.

When B = "Low", blink is off.

## 5) Extended Function Set ( RE = 1 )

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	0	0	1	FW	B/W	NW

FW : Font Width control

When FW = "High", display character font width is assigned to 6-dot and execution time becomes 6/5 times than that of 5-dot font width.

The user font, specified in CGRAM, is displayed into 6-dot font width, bit-5 to bit-0, including the leftmost space bit of CGRAM. (Refer to Fig-10)

When FW = "Low", 5-dot font width is set.

B/W : Black/White Inversion enable bit

When B/W = "High", black/white inversion at the cursor position is set. In this case C/B bit of display ON/OFF control instruction becomes don't care condition. If fosc has frequency of 270 kHz, inversion has 370 ms intervals.

NW : 4 Line mode enable bit

When NW = "High", 4 line display mode is set. In this case N bit of function set instruction becomes don't care condition.

Fig-10. 6-dot font width CGROM/CGRAM

6) Cursor or Display Shift (RE = 0)

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	0	1	S/C	R/L	-	-

Shift right/left cursor position or display, without writing or reading of display data  
 This instruction is used to correct or search display data.(Refer to Table 7)  
 During 2-line mode display, cursor moves to the 2nd line after 40th digit of 1st line.  
 In 4-line mode, cursor moves to the next line, only after every 20th digit of the current line.  
 Note that display shift is performed simultaneously in all the line.  
 When displayed data is shifted repeatedly, each line shifted individually.  
 When display shift is performed, the contents of address counter are not changed.

Table 11. Shift patterns according to S/C and R/L bits

S/C	R/L	Operation
0	0	Shift cursor to the left, ADDRESS COUNTER is decreased by 1
0	1	Shift cursor to the right, ADDRESS COUNTER is increased by 1
1	0	Shift all the display to the left, cursor moves according to the display
1	1	Shift all the display to the right, cursor moves according to the display

## 7) Scroll Enable (RE = 1)

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	0	1	HS4	HS3	HS2	HS1

## HS : Horizontal Scroll per Line Enable

This instruction makes valid dot shift by a display line unit.

HS1, HS2, HS3 and HS4 indicate each line to be dot scrolled, and each scroll is performed individually in each line.

If the line in 1-line display mode or the 1st line in 2-line display

mode is to be scrolled, set HS1 and HS2 to "High". If the 2nd line scroll is needed in 2-line mode, set HS3 and HS4 to "High". (refer to Table 8)

## 8) Function Set

## ① (RE = 0)

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	1	DL	N	RE (0)	-	-

## DL : Interface data length control bit

When DL = "High", it means 8-bit bus mode with MPU.

When DL = "Low", it means 4-bit bus mode with MPU. So to speak, DL is a signal to select 8-bit or 4-bit bus mode.

In 4-bit bus mode, it is required to transfer 4-bit data.

## N : Display line number control bit

It is variable only when NW bit of extended function set instruction is Low.

When N = "Low", 1-line display mode is set.

When N = "High", 2-line display mode is set.

When NW = "High", N bit is invalid, it means 4-line mode independent of N bit.

## RE : Extended function registers enable bit

At this instruction, RE must be "Low".

## ② (RE = 1)

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	1	DL	N	RE (1)	BE	0

**DL : Interface data length control bit**

When DL = "High", it means 8-bit bus mode with MPU.

When DL = "Low", it means 4-bit bus mode with MPU. Hence, DL is a signal to select 8-bit or 4-bit bus mode.

In 4-bit bus mode, it is required to transfer 4-bit data twice.

**N : Display line number control bit**

It is variable only when NW bit of extended function set instruction is Low.

When N = "Low", 1-line is set.

When N = "High", 2-line display mode is set.

When NW = "High", N bit is invalid, 4-line mode independent of N bit.

**RE : Extended function registers enable bit**

When RE = "High", extended function set registers, SEGRAM address set registers, HS bits of scroll enable instruction and BE bits of function set register can be accessed.

**BE : CGRAM/SEGRAM data blink enable bit**

If BE is "High", makes user font of CGRAM and segment of SEGRAM blinking. The quantity of blink is assigned the highest 2 bit of CGRAM/SEGRAM.

## 9) Set CGRAM Address (RE = 0)

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	1	AC5	AC4	AC3	AC2	AC1	AC0

**Set CGRAM address to AC.**

This instruction makes CGRAM data available from MPU.

## 10) Set SEGRAM Address (RE = 1)

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	1	-	-	AC3	AC2	AC1	AC0

**Set SEGRAM address to AC.**

This instruction makes SEGRAM data available from MPU.

## 11) Set DDRAM Address (RE = 0)

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	AC6	AC5	AC4	AC3	AC2	AC1	AC0

## Set DDRAM address to AC.

This instruction makes DDRAM data available from MPU.

In 1-line display mode (N = 0, NW = 0), DDRAM address is from "00H" to "4FH".

In 2-line display mode (N = 1, NW = 0), DDRAM address in the 1st line is from "00H" to "27H", and DDRAM address in the 2nd line is from "40H" to "67H".

In 4-line display mode (NW = 1), DDRAM address is from "00H" to "13H" in the 1st line, from "20H" to "33H" in the 2nd line, from "40H" to "53H" in the 3rd line and from "60H" to "73H" in the 4th line.

## 12) Set Scroll Quantity (RE = 1)

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	X	SQ5	SQ4	SQ3	SQ2	SQ1	SQ0

Setting SQ5 to SQ0, horizontal scroll quantity can be controlled in dot units. (Refer to Table 12).  
In this case of KS0075 execute dot smooth scroll from 1 to 48 dots.

Table 12. Scroll quantity according to HDS bits

SQ5	SQ4	SQ3	SQ2	SQ1	SQ0	Function
0	0	0	0	0	0	No shift
0	0	0	0	0	1	shift left by 1-dot
0	0	0	0	1	0	shift left by 2-dot
0	0	0	0	1	1	shift left by 3-dot
:	:	:	:	:	:	:
1	0	1	1	1	1	shift left by 47-dot
1	1	X	X	X	X	shift left by 48-dot

## 13) Read Busy Flag &amp; Address

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	1	BF	AC6	AC5	AC4	AC3	AC2	AC1	AC0

This instruction shows whether KS0075 is in internal operation or not. If the resultant BF is High, it means the internal operation is in progress and should to wait until BF to become "Low".

Which by then the next instruction can be performed. In this instruction value of address counter can also be read.

## 14) Write data to RAM

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
1	0	D7	D6	D5	D4	D3	D2	D1	D0

Write binary 8-bit data to DDRAM/CGRAM/SEGRAM.

The selection of RAM from DDRAM, CGRAM, or SEGRAM, is set by the previous address set instruction : DDRAM address set, CGRAM address set, SEGRAM address set. RAM set instruction can also determines the AC direction to RAM. After write operation, the address is automatically increased/decreased by 1, according to the entry mode.

## 15) Read data from RAM

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
1	1	D7	D6	D5	D4	D3	D2	D1	D0

Read binary 8-bit data from DDRAM/CGRAM/SEGRAM.

The selection of RAM is set by the previous address set instruction. If address set instruction of RAM is not performed before this instruction, the data that read first is invalid, as the direction of AC is not determined. If the RAM data is read several times without RAM address set instruction before read operation, the correct RAM data from the second, but the first data would be incorrect, as there is no time margin to transfer RAM data. In case of DDRAM read operation, cursor shift instruction plays the same role as DDRAM address set instruction : it also transfer RAM data to output data register. After read operation address counter is automatically increased/decreased by 1 according to the entry mode. After CGRAM/SEGRAM read operation, display shift may not be executed correctly.

\* In case of RAM write operation, AC is increased/decreased by 1 like read operation after this. In this time, AC indicates the next address position, but the previous data can only be read by read instruction.

**INTERFACE WITH MPU**

KS0075 can transfer data in bus mode (4-bit or 8-bit) or serial mode with MPU. Hence, both types of 4 or 8-bit MPU can be used. In case of 4-bit bus mode, data transfer is performed by twice to transfer 1 byte data.

(1) When interfacing data length are 4-bit, only 4 ports, from DB4 to DB7, are used as data bus.

At first higher 4-bit (in case of 8-bit bus mode, the contents of DB4 - DB7) are transferred, and then lower 4-bit (in case of 8-bit bus mode, the contents of DB0 - DB3) are transferred. So transfer is performed by twice. Busy Flag outputs "High" after the second transfer is ended.

(2) When interfacing data length are 8-bit, transfer is performed at a time through 8 ports, from DB0 to DB7.

(3) If IM is set to "Low", serial transfer mode is set.

**Interface with MPU in Bus Mode**

1) Interface with 8-bits MPU

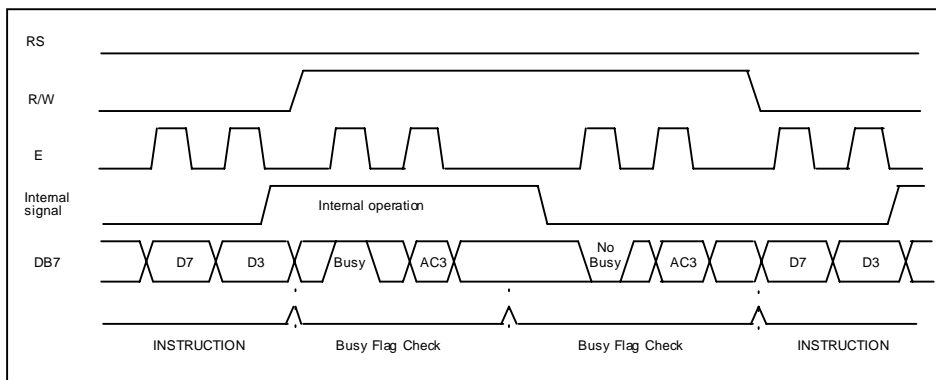

If 8-bits MPU is used, KS0075 can connect directly with that. In this case, port E, RS, R/W and DB0 to DB7 need to interface each other. Example of timing sequence is shown below.

**Fig 11. Example of 8-bit Bus Mode Timing Sequence**

2) Interface with 4-bits MPU

If 4-bits MPU is used, KS0075 can connect directly with this. In this case, port E, RS, R/W and DB4 to DB7 need to interface each other. The transfer is performed by twice. Example of timing sequence is shown below.

**Fig 12. Example of 4-bit Bus Mode Timing Sequence**

**Interface with MPU in Serial Mode**

When IM port input is "Low", serial interface mode is started. At this time, all three ports, SCLK (synchronizing transfer clock), SID (serial input data), and SOD (serial output data), are used. If KS0075 is to be used with other chips, chip select port (cs) be used.

By setting CS to "Low", KS0075 can receive SCLK input. If CS is set to "High", KS0075 reset the internal transfer counter.

Before transfer real data, start byte has to be transferred. It is composed of succeeding 5 "High" bits, read write control bit (R/W), register selection bit (RS), and end bit that indicates the end of start byte. Whenever succeeding 5 "High" bits are detected by KS0075, it resets serial transfer counter and prepares to receive next information.

The next input data are register selection bit which determine which register is to be used, and read write control bit that determine the direction of data. Then end bit is transferred, which must have "Low" value to show the end of start byte. (Refer to Fig 13. Fig 14)

**(1) Write Operation (R/W = 0)**

After start byte is transferred from MPU to KS0075, 8-bit data is transferred which is divided into 2 bytes, each byte has 4 bit's real data and 4 bit's partition token data. For example, if real data is "10110001" (D0 - D7), then serially transferred data becomes "1011 0000 0001 0000" where 2nd and 4th 4 bits must be "0000" for safe transfer.

To transfer several bytes continuously without changing R/W bit and RS bit, start byte transfer is needed only at first starting time. I.e., after first start byte is transferred, real data succeeding can be transferred.

**(2) Read Operation (R/W = 1)**

After start byte is transferred to KS0075, MPU can receive 8-bit data through the SOD port at a time from the LSB. Wait time is needed to insert between start byte and data reading, as internal reading from RAM requires some delay.

Continuous data reading is possible such as serial write operation. It also needs only one start bytes, only if some delay between reading operations of each byte is inserted. During the reading operation, KS0075 observes succeeding 5 "High" from MPU. If detected, KS0075 restarts serial operation at once and prepares to receive RS bit. So in continuous reading operation, SID port must be "Low".

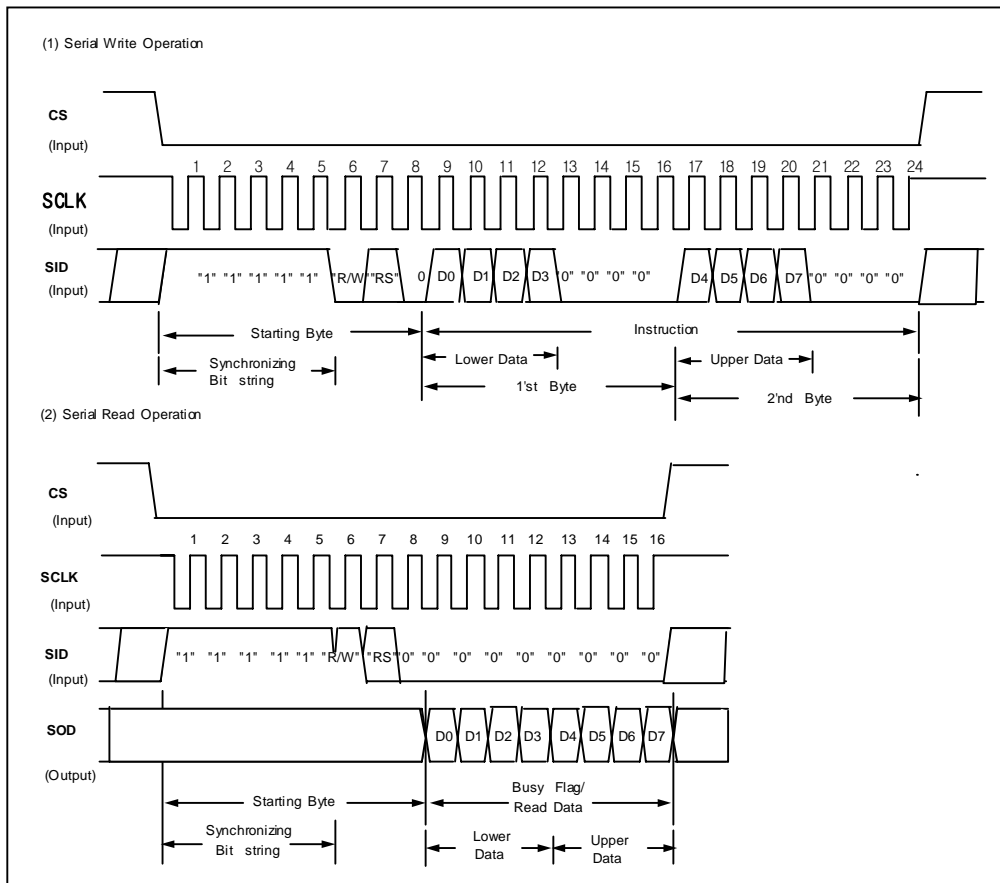

Fig 13. Timing Diagram of Serial Data Transfer

Fig 14. Timing Diagram of Continuous Data Transfer

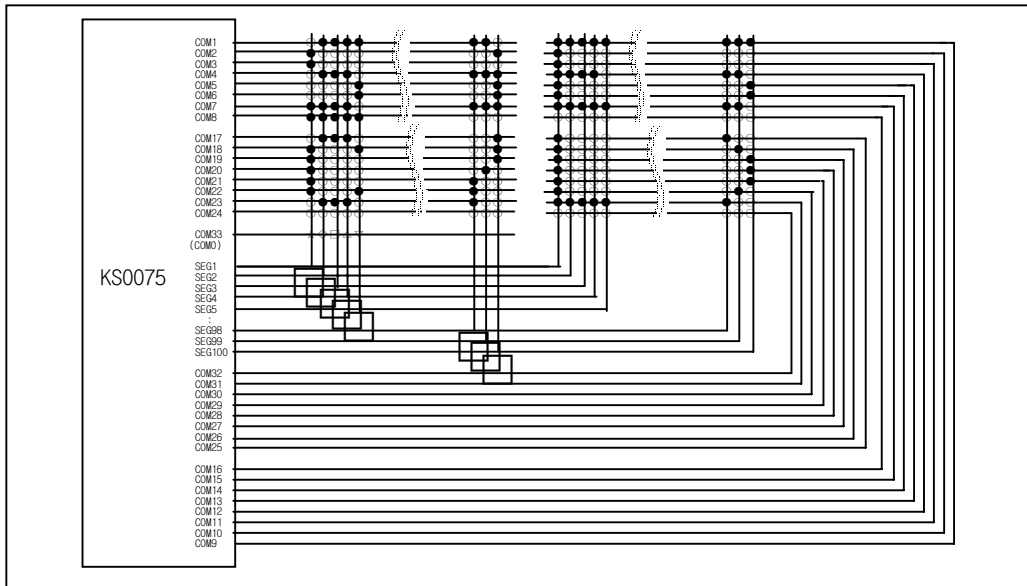

APPLICATION INFORMATION ACCORDING TO LCD PANEL

1) LCD Panel : 40 character x 1 line format (5-dot font, 1/17 duty)

2) LCD Panel : 40 character x 2 line format (5-dot font, 1/33 duty)

3) LCD Panel : 20 character x 4 line format (5-dot font, 1/33 bias)

4) LCD Panel : 16 character x 4 line format (6-dot font, 1/33 bias)

**INITIALIZING**

## 1) Initializing by Internal Reset Circuit

When the power is turned on, KS0075 is initialized automatically by power on reset circuit. During the initialization, the following instructions are executed, and BF(Busy Flag) is kept "High"(busy state) to the end of initialization.

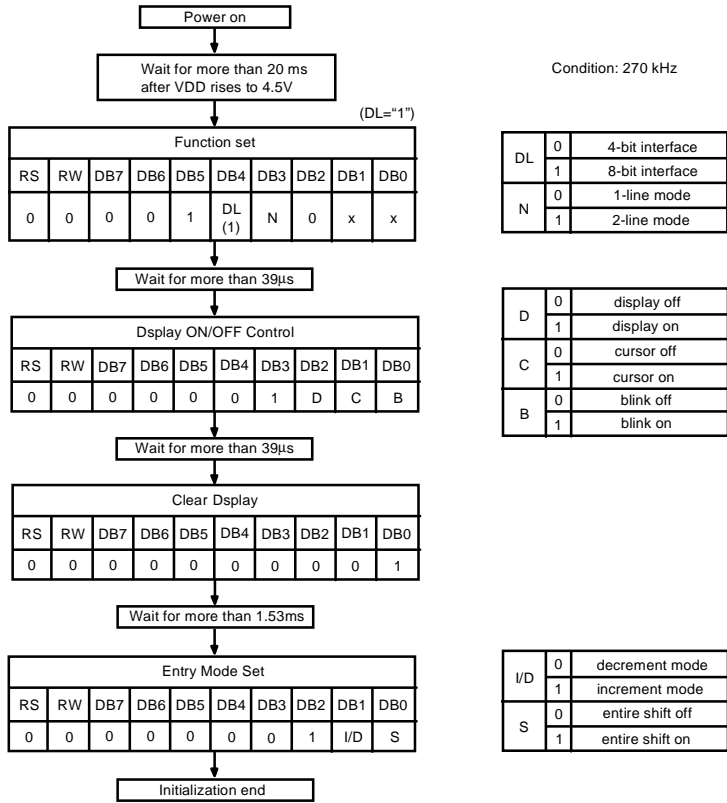

- ① Display Clear instruction  
Write "20H" to all DDRAM
- ② Set Functions instruction  
DL = 1 : 8-bit bus mode  
N = 1 : 2-line display mode  
RE = 0 : Extension register disable  
BE = 0 : CGRAM/SEGRAM blink OFF  
DH = 0 : Horizontal scroll enable  
REV = 0 : Normal display (Not reversed display)
- ③ Control Display ON/OFF instruction  
D = 0 : Display OFF  
C = 0 : Cursor OFF  
B = 0 : Blink OFF
- ④ Set Entry Mode instruction  
I/D = 1 : Increment by 1  
S = 0 : No entire display shift  
BID = 0 : Normal direction segment port
- ⑤ Set Extension Function instruction  
FW = 0 : 5-dot font width character display  
B/W = 0 : Normal cursor (8th line)  
NW = 0 : Not 4-line display mode, 2-line mode is set because of N("1")
- ⑥ Enable Shift instruction  
HS = 0000 : Scroll per line disable  
DS = 0000 : Shift per line disable
- ⑥ Set scroll Quantity instruction  
SQ = 000000 : Not scroll

## 2) Initializing by Hardware RESET input

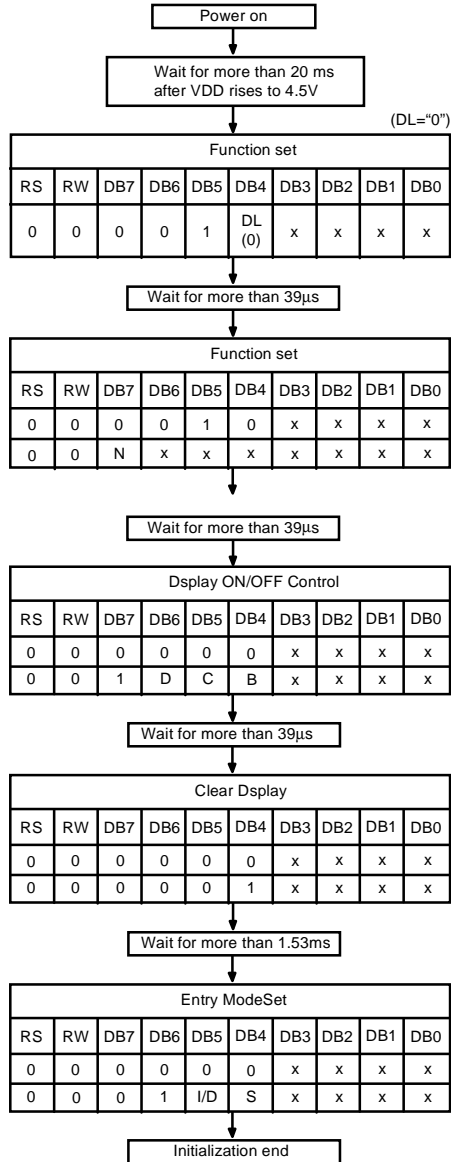

When RESET pin = "Low", KS0075 can be initialized like the case of power on reset. During the power on reset operation, this pin is ignored.

INITIALIZING BY INSTRUCTION

1) 8-bit interface mode

2) 4-bit interface mode

Condition: 270 kHz

DL	0	4-bit interface
	1	8-bit interface
N	0	1-line mode
	1	2-line mode

D	0	display off
	1	display on
C	0	cursor off
	1	cursor on
B	0	blink off
	1	blink on

I/D	0	decrement mode
	1	increment mode
S	0	entire shift off
	1	entire shift on

**EXAMPLE OF INSTRUCTION AND DISPLAY CORRESPONDENCE**

**FRAME FREQUENCY**

1) 1/17 duty cycle

Item	Display Font Width	
	5-dot font width	6-dot font width
1-line selection period	200 clocks	240 clocks
Frame frequency	79.4Hz	66.2Hz

\* fosc = 270 kHz (1 clock = 3.7μs)

2) 1/33 duty cycle

Item	Display Font Width	
	5-dot font width	6-dot font width
1-line selection period	100 clocks	120 clocks
Frame frequency	81.8Hz	68.2Hz

※ fosc = 270 kHz (1 clock = 3.7 μs)

**POWER SUPPLY FOR DRIVING LCD PANEL**

1) When an external power supply is used

2) When an internal booster is used

- ※ 1. Boosted output voltage should not exceed the maximum value (13 V) of the LCD driving voltage. Especially, a voltage of over 4.3V should not be input to the reference voltage (Vci) when boosting three times.
- 2. A voltage of over 5.5V should not be input to the reference voltage (Vci) when boosting twice.
- 3. The value of resistance, according to the number of lines, duty ratio and the bias, is shown below. (Refer to Table 13)

Table 13. Duty Ratio and Power Supply for LCD Driving

Item		Data	
Number of lines		1	2 or 4
Duty ratio		1/17	1/33
Bias		1/5	1/6.7
Divided resistance	R	R	R
	R0	R	2.7R

**MAXIMUM ABSOLUTE RATE**

Characteristic	Symbol	Value	Unit
Power Supply Voltage (1)	$V_{DD}$	-0.3 ~ +7.0	V
Power Supply Voltage (2)	$V_{LCD}$	$V_{DD} - 15.0 \sim V_{DD} + 0.3$	V
Input Voltage	$V_{IN}$	-0.3 ~ $V_{DD} + 0.3$	V
Operating Temperature	$T_{OPR}$	-30 ~ +85	°C
Storage Temperature	$T_{STG}$	-55 ~ +125	°C

※ Voltage greater than above may damage to the circuit ( $V_{DD} \geq V_1 \geq V_2 \geq V_3 \geq V_4 \geq V_5$ )

---

## ELECTRICAL CHARACTERISTICS

## DC Characteristics

(VDD = 2.7V ~ 5.5V, Ta = -30 ~ + 85 °C)

Characteristic	Symbol	Condition	Min	Typ	Max	Unit	
Operating Voltage	V <sub>DD</sub>	-	2.7	-	5.5	V	
Supply Current	I <sub>DD</sub>	Internal oscillation or external clock. (V <sub>DD</sub> =3.0V, f <sub>osc</sub> =270KHz)	-	0.15	0.3	mA	
Input Voltage (1) (Except OSC1)	V <sub>IH1</sub>	-	0.7V <sub>DD</sub>	-	V <sub>DD</sub>	-	
	V <sub>IL1</sub>	V <sub>DD</sub> =2.7 to 3.0	-0.3	-	0.2V <sub>DD</sub>		
		V <sub>DD</sub> =3.0 to 5.5	-0.3	-	0.6		
Input Voltage (2) (Osc1)	V <sub>IH2</sub>	-	0.7V <sub>DD</sub>	-	V <sub>DD</sub>	V	
	V <sub>IL2</sub>	-	-	-	0.2V <sub>DD</sub>		
Output Voltage (1) (DB0 To DB7)	V <sub>OH1</sub>	I <sub>OH</sub> =-0.1 mA	0.75V <sub>DD</sub>	-	-	V	
	V <sub>OL1</sub>	I <sub>OL</sub> =0.1 mA	-	-	0.2V <sub>DD</sub>		
Output Voltage(2) (Except DB0 To Db7)	V <sub>OH2</sub>	I <sub>O</sub> =-40 μA	0.8V <sub>DD</sub>	-	-	V	
	V <sub>OL1</sub>	I <sub>O</sub> =40 μA	-	-	0.2V <sub>DD</sub>		
Voltage Drop	V <sub>dCOM</sub>	I <sub>O</sub> = ±0.1mA	-	-	1	V	
	V <sub>dSEG</sub>		-	-	1		
Input Leakage Current	I <sub>LKG</sub>	V <sub>IN</sub> =0V to V <sub>DD</sub>	-1	-	1	μA	
Low Input Current	I <sub>IL</sub>	V <sub>IN</sub> =0V, V <sub>DD</sub> =3V (PULL UP)	-10	-50	-120		
Internal Clock (external Rf)	f <sub>OSC</sub>	Rf=91[kΩ] ±2% (V <sub>DD</sub> =5V)	190	270	350	KHz	
External Clock	f <sub>EC</sub>	-	125	270	410	KHz	
	duty		45	50	55	%	
	t <sub>R</sub> , t <sub>F</sub>		-	-	0.2	μs	
Voltage Converter Out2 (Vci = 4.5V)	V <sub>OUT2</sub>	Ta = 25 °C, C=1μF, I <sub>OUT</sub> = 0.25mA, f <sub>OSC</sub> =270KHz	-3.0	-4.2	-	V	
Voltage Converter Out3 (Vci = 2.7V)	V <sub>OUT3</sub>		-4.3	-5.1	-		
Voltage Converter Input	Vci	-	1.0	-	4.5	V	
LCD Driving Voltage	V <sub>LCD</sub>	V <sub>DD</sub> -V5	1/5 Bias	3.0	-		13.0
			1/6.7 Bias	3.0	-		13.0

**AC Characteristics**(V<sub>DD</sub>=4.5~ 5.5V, T<sub>a</sub>=-30 ~ +85 °C)

Mode	Item	Symbol	Min	Typ	Max	Unit
(1) Write Mode (refer to Fig-15)	E Cycle Time	t <sub>c</sub>	500	-	-	ns
	E Rise / Fall Time	t <sub>r</sub> , t <sub>f</sub>	-	-	20
