

## GaAs pHEMT MMIC 1 WATT POWER AMPLIFIER, 24 - 29.5 GHz

### Typical Applications

The HMC864 is ideal for:

- Point-to-Point Radios
- Point-to-Multi-Point Radios
- VSAT
- Military & Space

### Features

- Saturated Output Power: +31 dBm @ 18% PAE
- High Output IP3: +40 dBm
- High Gain: 27 dB
- DC Supply: +6V @ 750mA
- No External Matching Required
- Die Size: 2.41 x 1.65 x 0.1 mm

### Functional Diagram

### General Description

The HMC864 is a three stage GaAs pHEMT MMIC 1 Watt Power Amplifier which operates between 24 and 29.5 GHz. The HMC864 provides 27 dB of gain, and +31 dBm of saturated output power and 18% PAE from a +6V supply. The RF I/Os are DC blocked and matched to 50 Ohms for ease of integration into Multi-Chip-Modules (MCMs). All data is taken with the chip in a 50 Ohm test fixture connected via 0.025 mm (1 mil) diameter wire bonds of length 0.31 mm (12 mils).

### Electrical Specifications, $T_A = +25^\circ\text{C}$ , $V_{dd} = V_{dd1} = V_{dd2} = +6\text{V}$ , $I_{dd} = 750\text{mA}$ [1]

Parameter	Min.	Typ.	Max.	Min.	Typ.	Max.	Units
Frequency Range	24 - 27		27 - 29.5				GHz
Gain	24	27		22	25		dB
Gain Variation Over Temperature		0.021			0.027		dB/ °C
Input Return Loss		27			25		dB
Output Return Loss		19			14		dB
Output Power for 1 dB Compression (P1dB)	27	29		27	29		dBm
Saturated Output Power (P <sub>sat</sub> )		31			30		dBm
Output Third Order Intercept (IP <sub>3</sub> ) <sup>[2]</sup>		39			40		dBm
Total Supply Current (I <sub>dd</sub> )		750			750		mA

[1] Adjust V<sub>gg</sub> between -2 to 0V to achieve I<sub>dd</sub> = 750mA typical.

[2] Measurement taken at +6V @ 750mA, P<sub>out</sub> / Tone = +19 dBm

**Mounting & Bonding Techniques for Millimeterwave GaAs MMICs**

The die should be attached directly to the ground plane eutectically or with conductive epoxy (see HMC general Handling, Mounting, Bonding Note).

50 Ohm Microstrip transmission lines on 0.127mm (5 mil) thick alumina thin film substrates are recommended for bringing RF to and from the chip (Figure 1). If 0.254mm (10 mil) thick alumina thin film substrates must be used, the die should be raised 0.150mm (6 mils) so that the surface of the die is coplanar with the surface of the substrate. One way to accomplish this is to attach the 0.102mm (4 mil) thick die to a 0.150mm (6 mil) thick molybdenum heat spreader (moly-tab) which is then attached to the ground plane (Figure 2).

Microstrip substrates should be located as close to the die as possible in order to minimize bond wire length. Typical die-to-substrate spacing is 0.076mm to 0.152 mm (3 to 6 mils).

**Handling Precautions**

Follow these precautions to avoid permanent damage.

**Storage:** All bare die are placed in either Waffle or Gel based ESD protective containers, and then sealed in an ESD protective bag for shipment. Once the sealed ESD protective bag has been opened, all die should be stored in a dry nitrogen environment.

**Cleanliness:** Handle the chips in a clean environment. DO NOT attempt to clean the chip using liquid cleaning systems.

**Static Sensitivity:** Follow ESD precautions to protect against > ± 250V ESD strikes.

**Transients:** Suppress instrument and bias supply transients while bias is applied. Use shielded signal and bias cables to minimize inductive pick-up.

**General Handling:** Handle the chip along the edges with a vacuum collet or with a sharp pair of bent tweezers. The surface of the chip may have fragile air bridges and should not be touched with vacuum collet, tweezers, or fingers.

**Mounting**

The chip is back-metallized and can be die mounted with AuSn eutectic preforms or with electrically conductive epoxy. The mounting surface should be clean and flat.

**Eutectic Die Attach:** A 80/20 gold tin preform is recommended with a work surface temperature of 255 °C and a tool temperature of 265 °C. When hot 90/10 nitrogen/hydrogen gas is applied, tool tip temperature should be 290 °C. DO NOT expose the chip to a temperature greater than 320 °C for more than 20 seconds. No more than 3 seconds of scrubbing should be required for attachment.

**Epoxy Die Attach:** Apply a minimum amount of epoxy to the mounting surface so that a thin epoxy fillet is observed around the perimeter of the chip once it is placed into position. Cure epoxy per the manufacturer's schedule.

**Wire Bonding**

Ball or wedge bond with 0.025mm (1 mil) diameter pure gold wire. Thermosonic wirebonding with a nominal stage temperature of 150 °C and a ball bonding force of 40 to 50 grams or wedge bonding force of 18 to 22 grams is recommended. Use the minimum level of ultrasonic energy to achieve reliable wirebonds. Wirebonds should be started on the chip and terminated on the package or substrate. All bonds should be as short as possible <0.31mm (12 mils).
