

TOSHIBA BIPOLAR LINEAR INTEGRATED CIRCUIT SILICON MONOLITHIC

# TA8435H

## PWM CHOPPER TYPE BIPOLAR STEPPING MOTOR DRIVER.

The TA8435H is PWM chopper type sinusoidal micro step bipolar stepping motor driver.

Sinusoidal micro step operation is accomplished only a clock signal inputting by means of built-in hard ware.

### FEATURES

- 1 chip bipolar sinusoidal micro step stepping motor driver.
- Output current up to 1.5 A (AVE.) and 2.5 A (PEAK).
- PWM chopper type.
- Structured by high voltage Bi-CMOS process technology.
- Forward and reverse rotation are available.
- 2, 1-2, W1-2, 2W1-2 phase 1 or 2 clock drives are selectable.
- Package : HZIP25-P
- Input Pull-up Resistor equipped with  $\overline{\text{RESET}}$  Terminal :  $R = 100 \text{ k}\Omega$  (Typ.)
- Output Monitor available with  $\overline{\text{MO}}$ .  $I_{O(\overline{\text{MO}})} = \pm 2 \text{ mA}$  (MAX.)
- Reset and Enable are available with  $\overline{\text{RESET}}$  and  $\overline{\text{ENABLE}}$ .

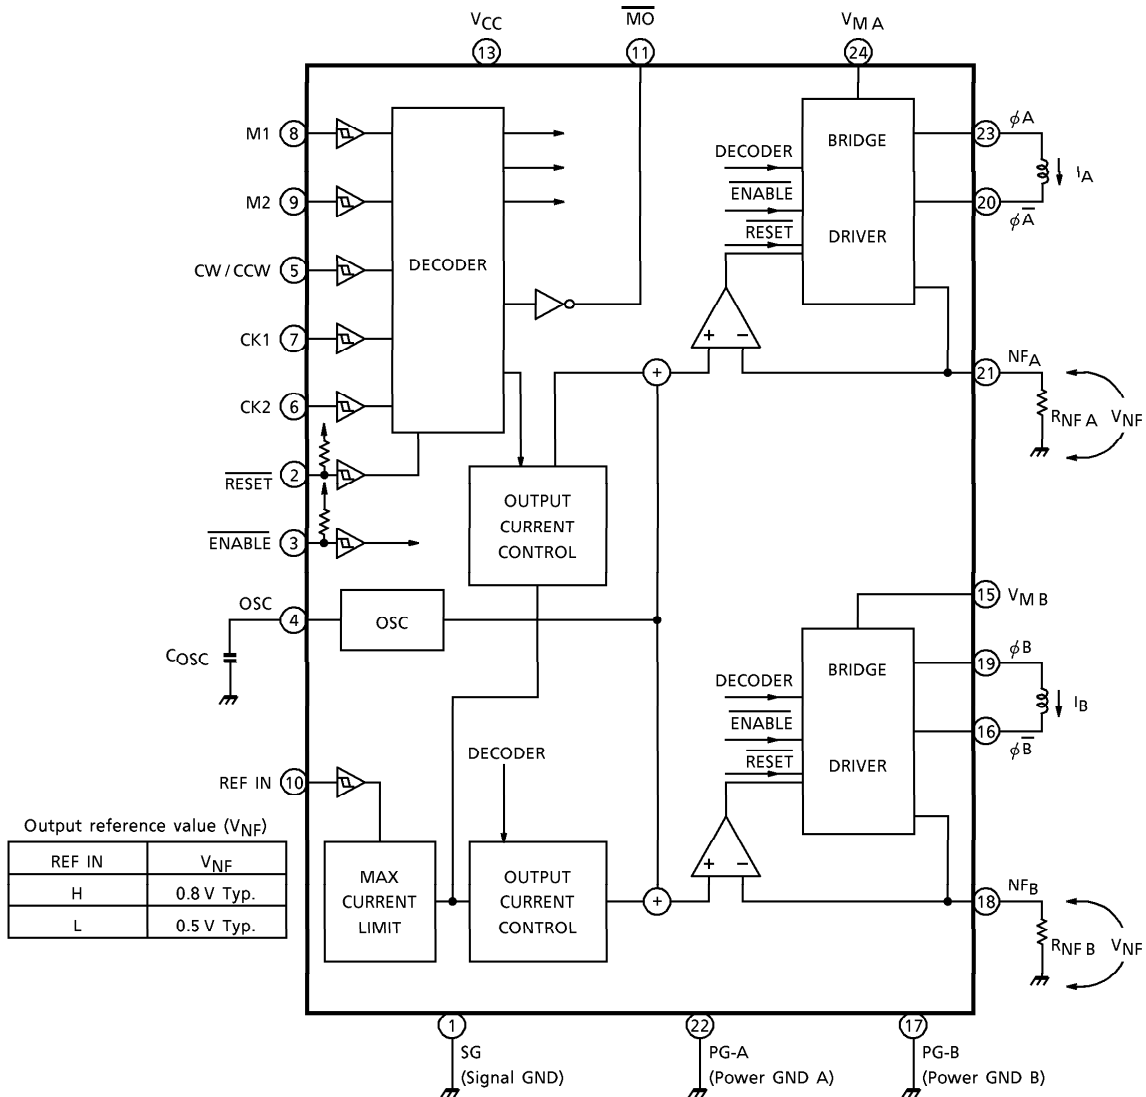

Weight : 9.86 g (Typ.)

980910EBA1

- TOSHIBA is continually working to improve the quality and the reliability of its products. Nevertheless, semiconductor devices in general can malfunction or fail due to their inherent electrical sensitivity and vulnerability to physical stress. It is the responsibility of the buyer, when utilizing TOSHIBA products, to observe standards of safety, and to avoid situations in which a malfunction or failure of a TOSHIBA product could cause loss of human life, bodily injury or damage to property. In developing your designs, please ensure that TOSHIBA products are used within specified operating ranges as set forth in the most recent products specifications. Also, please keep in mind the precautions and conditions set forth in the TOSHIBA Semiconductor Reliability Handbook.
- The products described in this document are subject to the foreign exchange and foreign trade laws.
- The information contained herein is presented only as a guide for the applications of our products. No responsibility is assumed by TOSHIBA CORPORATION for any infringements of intellectual property or other rights of the third parties which may result from its use. No license is granted by implication or otherwise under any intellectual property or other rights of TOSHIBA CORPORATION or others.
- The information contained herein is subject to change without notice.

**BLOCK DIAGRAM**

Pull-up resistance : 100 kΩ (Typ.)  
 Pin 12、14、25 : Non connection

**PIN CONNECTION (Top view)**

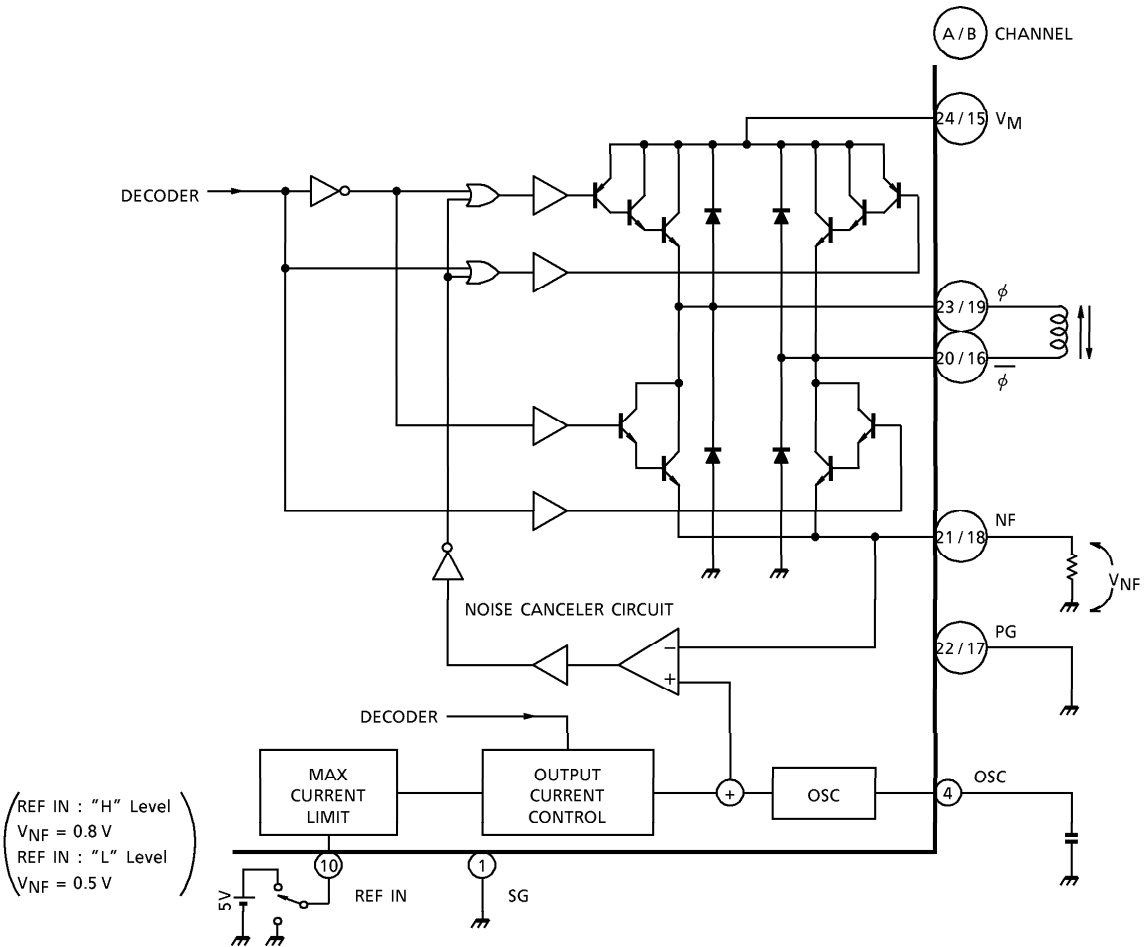

(Note) : NC : No connection

## PIN FUNCTION

PIN No.	SYMBOL	FUNCTIONAL DESCRIPTION
1	SG	Signal GND.
2	$\overline{\text{RESET}}$	L : RESET.
3	$\overline{\text{ENABLE}}$	L : ENABLE, H : OFF.
4	OSC	Chopping oscillation is determined by the external capacitor.
5	CW / CCW	Forward / Reverse switching terminal.
6	CK2	Clock input terminal.
7	CK1	Clock input terminal.
8	M1	Excitation control input
9	M2	Excitation control input
10	REF IN	$V_{\text{NF}}$ control input
11	$\overline{\text{MO}}$	Monitor output
12	NC	No connection.
13	$V_{\text{CC}}$	Voltage supply for logic.
14	NC	No connection.
15	$V_{\text{MB}}$	Output power supply terminal.
16	$\phi\text{B}$	Output $\phi\overline{\text{B}}$
17	PG-B	Power GND.
18	$\text{NF}_{\text{B}}$	B-ch output current detection terminal.
19	$\phi\text{B}$	Output $\phi\text{B}$
20	$\phi\overline{\text{A}}$	Output $\phi\overline{\text{A}}$
21	$\text{NF}_{\text{A}}$	A-ch output current detection terminal.
22	PG-A	Power GND
23	$\phi\text{A}$	Output $\phi\text{A}$
24	$V_{\text{MA}}$	Output power supply terminal.
25	NC	No connection.

OUTPUT CIRCUIT

INPUT CIRCUIT

- CK1, CK2, CW/CCW, M1, M2, REF IN : Terminals

- RESET, ENABLE : Terminals

100 kΩ of Pull-up Resistor is equipped.

- OSC : Terminal

**OSC FREQUENCY CALCULATION**

Sawtooth OSC circuit consists of Q<sub>1</sub> through Q<sub>4</sub> and R1 through R4.

Q<sub>2</sub> is turned "off" when V<sub>OSC</sub> is less than the voltage of 2.5V + V<sub>BE</sub> Q<sub>2</sub> approximately equal to 2.85V.

V<sub>OSC</sub> is increased by C<sub>OSC</sub> charging through R1.

Q<sub>3</sub> and Q<sub>4</sub> are turned "on" when V<sub>OSC</sub> becomes 2.85V (Higher level.)

Lower level of V ④ pin is equal to V<sub>BE</sub> Q<sub>2</sub> + V<sub>SAT</sub> Q<sub>4</sub> approximately equal to 1.4V.

V<sub>OSC</sub> is calculated by following equation.

$$V_{OSC} = 5 \cdot \left( 1 - \exp\left(-\frac{t}{C_{OSC} \cdot R1}\right) \right) \dots\dots\dots \textcircled{1}$$

Assuming that V<sub>OSC</sub> = 1.4V (t = t<sub>1</sub>) and = 2.85V (t = t<sub>2</sub>)

C<sub>OSC</sub> is external capacitance connected to pin④ and R1 is on-chip 10kΩ resistor.

Therefore, OSC frequency is calculated as follows.

$$t_1 = -C_{OSC} \cdot R1 \cdot \ln\left(1 - \frac{1.4}{5}\right) \dots\dots\dots \textcircled{2}$$

$$t_2 = -C_{OSC} \cdot R1 \cdot \ln\left(1 - \frac{2.85}{5}\right) \dots\dots\dots \textcircled{3}$$

$$f_{OSC} = \frac{1}{t_2 - t_1} = \frac{1}{C_{OSC} \left( R1 \cdot \ln\left(1 - \frac{1.4}{5}\right) - R1 \cdot \ln\left(1 - \frac{2.85}{5}\right) \right)}$$

$$= \frac{1}{5.15 \cdot C_{OSC}} \text{ (kHz) (C}_{OSC} : \mu\text{F)}$$

**ENABLE AND RESET FUNCTION AND MO SIGNAL**

Fig.1 1-2 Phase drive mode (M1 : H, M2 : L)

ENABLE Signal disables only Output Signal.

Internal logic functions are proceeded by CK signal without regard to ENABLE signal.

Therefore, Output Current is initiated from the proceeded timing point of internal logic circuit after release of disable mode.

Fig.1 shows the ENABLE functions, when the system is selected in 1-2 Phase drive mode.

Fig.2 1-2 Phase drive mode (M1 : H, M2 : L)

Low level active of RESET Signal offs not only the Outputs but also stops internal CK functions and MO to low.

Outputs are initiated from the initial point after release of RESET (High) as shown in Fig.2.

MO (Monitor Output) Signals can be used as rotation and initial signal for stable rotation checking.

**FUNCTION**

INPUT					MODE

APPLICATION CIRCUIT

- (Note 1) : Schottky diode (3GWJ42) to be connected additionally between each output (pin 16 / 19 / 20 / 23) and GND for preventing Punch-Through Current
- (Note 2) : GND pattern to be laid out at one point in order to prevent common impedance.
- (Note 3) : Capacitor for noise suppression to be connected between the Power Supply ( $V_{CC}$ ,  $V_M$ ) and GND to stabilize the operation.
- (Note 4) : Utmost care is necessary in the design of the output line,  $V_M$  and GND line since IC may be destroyed due to short-circuit between outputs, air contamination fault, or fault by improper grounding.

When using TA8435H

0. Introduction

The TA8435H controls PWM to set the stepping motor winding current to constant current. The device is a micro-step driver IC used to efficiently drive the stepping motor at low vibration.

1. About micro-step drive

The TA8435H drives a stepping motor in micro steps with a maximum resolution of 1/8 of the 2-phase stepping angle (in 2W1-2 phase mode).

In micro steps, A-phase and B-phase current levels are set inside the IC so that the composite vector size and the rotation angle are even. Just inputting clock signals rotates the stepping motor in micro steps.

2. About PWM control and output current setting

(1) Output current path (PWM control)

The TA8435H controls PWM by turning the upper power transistor on/off. In such a case, current flows as shown in the figure below.

(2) Setting of output current by REF-IN input and current detection resistor

The motor current (maximum current for micro-step drive)  $I_O$  is set as shown in the following equation, using REF-IN input and the external current detection resistor  $R_{NF}$ .

$$I_O = V_{REF} / R_{NF}$$

where,

REF - IN = High,  $V_{REF} = 0.8\text{ V}$

REF - IN = Low,  $V_{REF} = 0.5\text{ V}$

3. Logic control

(1) Clock input for rotation direction control

To switch rotation between forward and reverse, there are two clock input types: 1-clock input and 2-clock input.

(a) 1-clock input

Uses either clock pin CK1 or CK2.

Switches rotation between forward or reverse using the CW or CCW signal.

<Input signal example: 1-2 phase mode>

(b) 2-clock input

Uses both clock pins CK1 and CK2.

Switching between CK1 and CK2 controls forward /reverse rotation.

<Input signal example: 1-2 phase mode>

(2) Mode setting

Setting M1 and M2 selects one of the following modes: 2-phase, 1-2 phase, W1-2 phase, and 2W1-2 phase modes.

(3) Monitor ( $\overline{MO}$ ) output

Supports the monitor output used to monitor the current waveform location.

For 2-phase mode,  $\overline{MO}$  output is Low at the timing of A-phase current = 100% and B-phase current = -100%.

For 1-2 phase, W1-2 phase, or 2W1-2 phase mode,  $\overline{MO}$  output is Low at the timing of A-phase current = 100% and B-phase current = 0%.

(4) Reset pin

Supports reset input used to reset the internal counter.

Setting RESET to Low resets the internal counter, forcing the output current to the same value as that when the  $\overline{MO}$  output is Low.

(5) Phase mode switching

To avoid the step changing during motor rotation, current must not fluctuate at phase mode switching. Pay attention to the following points.

(a) When switching between 2-phase and other phase modes, current fluctuates.

(b) When switching between phase modes other than 2-phase, current can be switched without fluctuation at the timing of  $\overline{MO}$  output = Low.

However, when switching as follows, set RESET to Low beforehand:

From 1-2 phase to W1-2 phase or 2W1-2 phase mode

From W1-2 phase to 2W1-2 phase mode

<Example of Input Signal>

#### 4. About PWM oscillation frequency (external capacitor setting)

An external capacitor connected to the OSC pin is used to internally generate a sawtooth waveform. PWM is controlled using this frequency.

Toshiba recommend 3300 pF for the capacitance by taking variation between ICs into consideration.

#### 5. About external Schottky diode

A parasitic diode is created on the lower side of the output. When PWM is controlled, current flows to the parasitic diode. This current results in a punch-through current and micro-step waveform fluctuation. Therefore, make sure to externally connect a Schottky barrier diode.

The external diode can reduce heat generated in the IC.

#### 6. Power dissipation

The IC power dissipation is determined by the following equation (In a case where shottky diode is connected between Output pin and GND):

$$P = V_{CC} \times I_{CC} + V_M \times I_M + I_O (t_{ON} \times V_{SAT-U} + V_{SAT-L})$$
$$t_{ON} = T_{ON} / T_S (\text{PWM control ON duty})$$

The higher the ambient temperature, the smaller the power dissipation.

Check the  $P_D$ - $T_a$  curve and design heat dissipation with a sufficient margin.

#### 7. About heatsink fin processing

The IC fin (rear) is electrically connected to the rear of the chip.

When current flows to the fin, the IC malfunctions.

If there is any possibility of a voltage being generated between the IC GND and the fin, either ground the fin or insulate it.
