DESCRIPTION

This family is a 4M bit dynamic RAM organized 262,144 x 16-bit configuration with CMOS DRAMs. The circuit and process design allow this device to achieve high performance and low power dissipation. Optional features are access time(50, 60 or 70ns), package type(SOJ or TSOP-II) and power consumption (Normal or Low power with self refresh). Hyundai'sadvanced circuit design and process technology allow this device to achieve high bandwidth, low power consumption and high reliability.

FEATURES

- Fast page mode operation
- Read-modify-write Capability
- 2/CAS inputs for upper and lower byte control
- TTL compatible inputs and outputs
- /CAS-before-/RAS, /RAS-only, Hidden and Self refresh capability
- JEDEC standard pinout
- 40-pin Plastic SOJ (400mil)
  40/44-pin plastic TSOP-II (400mil)
- Single power supply of 5V $\pm$ 10%
- Early Write or output enable controlled write

- Max. Active power dissipation

Note

1. I_{CC1}, I_{CC3}, I_{CC4} and I_{CC6} depend on output loading and cycle rates(t_{RC} and t_{PC}).
2. Specified values are obtained with output unloaded.
3. I_{CC} is specified as an average current. In I_{CC1}, I_{CC3}, I_{CC6}, address can be changed only once while /RAS=V_{IL}. In I_{CC4}, address can be changed maximum once while /CAS=V_{IH} withen one FP mode cycle time t_{PC}.
4. Only tRAS(max) = 1µs is applied to refresh of battery backup but tRAS(max) = 10µs is to applied to normal functional operation.
5. Icc5(max.), Icc7 and Icc8 are applied to SL-part only.
6. Operating condition for 50ns part is Vcc=5V¡ 5%,Cout 50pF.

NOTE

1. An initial pause of 200μs is required after power-up followed by 8 /RAS only refresh cycles before proper device operation is achieved. In case of using internal refresh counter, a minimum of 8 CBR refresh cycles instead of 8 /RAS-only refresh cycles are required.
2. If /RAS=Vss during power-up,the HY514260B could begin an active cycle. This condition results in higher current than necessary current which is demanded from the power supply during power-up. It is recommended that /RAS and /CAS track with Vcc during power-up or be held at a valid VIH in other to minimize the power-up current.
3. VIH(min.) and VIL(max.) are reference levels for measuring timing of input signals. Transition times are measured between VIH(min.) and VIL(max.),and are assumed to be 5ns for all inputs.
4. Measured at V_{OH}=2.0V and V_{OL}=0.8V with a load equivalent to 2TTL loads and 100pF.
5. t_{OFF} and t_{OEZ} define the time at which the output achieves the open circuit condition and is not referenced to output voltage levels.
6. Either t_{RCH} or t_{RRH} must be satisfied for a read cycle.
7. These parameters are referenced to /LCAS or /UCAS leading edge in early write cycles and to /WE leading edge in read-modify-write cycles.
8. t_{WCS}, t_{RWD}, t_{CWD}, t_{AWD} and t_{CPWD} are not restrictive operating parameters. They are included in the data sheet as electrical characteristics only. If $t_{WCS} \geq t_{WCS(min.)}$, the cycle is an early write cycle and data out pin will remain open circuit (high impedance) through the entire cycle. If $t_{RWD} \geq t_{RWD(min.)}$, $t_{CWD} \geq t_{CWD(min.)}$, $t_{AWD} \geq t_{AWD(min)}$, and $t_{CPWD} \geq t_{CPWD(min.)}$, the cycle is a read-modify-write cycle and data out will contain data read from the selected cell. If neither of the above sets of conditions is satisfied, the condition of the data out (at access time) is indeterminate.
9. Operation within the $t_{RCD(max.)}$ limit ensures that $t_{RAC(max.)}$ can be met. $t_{RCD(max.)}$ is specified as a reference point only. If t_{RCD} is greater than the specified $t_{RCD(max.)}$ limit, then access time is controlled by t_{CAC}.
10. Operation within the $t_{RAD(max.)}$ limit ensures that $t_{RAC(max.)}$ can be met. $t_{RAD(max.)}$ is specified as a reference point only. If t_{RAD} is greater than the specified $t_{RAD(max.)}$ limit, then access time is controlled by t_{AA}.
11. tREF(max.)=128ms is applied to SL-parts only.
12. A burst of 512 CBR refresh cycles must be executed within 8ms (128ms for SL-part) after exiting self refresh.
13. When both /LCAS and /UCAS go low at the same time, all 16-bits data are written into the device. /LCAS and /UCAS must be transited simultaneously withen a same read or write cycle.
14. These parameters are determined by the earlier falling edge of /LCAS and /UCAS.
15. These parameters are determined by the later rising edge of /LCAS or /UCAS.
16. tCWL must be satisfied by both /LCAS and /UCAS for 16-bits access cycles.
17. tCP and tCPT are measured when both /LCAS and /UCAS are high state.
18. Operating condition for 50ns part is Vcc=5V ¡ 5%, Cout=50pF.
