SY10E416  
SY100E416

## FEATURES

- Differential D and Q
- Extended 100E VEE range of  $-4.2V$  to  $-5.5V$
- VBB output for single-ended use
- 600ps max. propagation delay
- High frequency outputs
- 2 stages of gain
- Internal  $75K\Omega$  input pull-down resistors
- Fully compatible with Motorola 10E/100E416
- Available in 28-pin PLCC package

## DESCRIPTION

The SY10/100E416 are 5-bit differential line receiving devices. The 2.0GHz of bandwidth provided by the high frequency outputs make the devices ideal for buffering of very high speed oscillators.

A VBB pin is available to AC couple an input signal to the devices.

The design incorporates two stages of gain internal to the devices, making them an excellent choice for use in high bandwidth amplifier applications.

### DC ELECTRICAL CHARACTERISTICS

VEE = VEE (Min.) to VEE (Max.); VCC = VCCO = GND

V <sub>CMR</sub>	Common Mode Range	-1.5	—	0	-1.5	—	0	-1.5	—	0	V	2

**Notes:**

- Differential input voltage required to obtain a full ECL swing on the outputs.
- V<sub>CMR</sub> is referenced to the most positive side of the differential input signal. Normal operation is obtained when the input signals are within the V<sub>CMR</sub> range and the input swing is greater than V<sub>PP</sub> (min.) and <1V.

**Notes:**

- Within-device skew is defined as identical transitions on similar paths through a device.
- Duty cycle skew defined only for differential operation when the delays are measured from the cross point of the inputs to the cross point of the outputs.
- Minimum input swing for which AC parameters are guaranteed.
