

VIDEO AMPLIFIER WITH LPF

■GENERAL DESCRIPTION

The **NJM41031** is a Video Amplifier contained LPF circuit. Internal 75Ω driver is easy to connect TV monitor directly.

Corresponds to the AC coupling and DC coupling.

The **NJM41031** features low power and small package, and is suitable for low power design on downsizing.

* When coupled DC, 0.33V output is always.

■PACKAGE OUTLINE

■FEATURES

- Operating Voltage 4.5 to 5.5V
- Internal LPF -40dB at 108MHz typ.
- 6dB Amplifier
- 75Ω Driver Circuit
- Power Save Circuit
- CMOS Technology
- Package Outline SOT-23-6

■PIN CONFIGURATION

- SOT-23-6
1. Power Save
 2. Vout
 3. Vsag
 4. Vin
 5. GND
 6. V⁺

APPLICATION CIRCUIT

(1) Standard circuit

(2) SAG correction unused circuit

(3) Two-line driving circuit

(1) Standard circuit

This circuit is for a portable equipment of small mounting space.

The SAG correction reduces output coupling capacitor values.

However, this circuit may cause to SAG deterioration, and lose synchronization by luminance fluctuation.

Adjust the C1 value, checking the waveform containing a lot of low frequency components like a bounce waveform (Worst condition waveform of SAG). Change the capacitor of C1 into a large value to improve SAG.

(2) SAG correction unused circuit

We recommend this circuit when there is no space limitation.

Connect the coupling capacitor after connecting the Vout pin and Vsag pin. The recommended value is 470µF or more.

(3) Two-line driving circuit

This circuit drives two-line of 150Ω. However, it may cause to lose synchronization by an input signal of large APL change (100% white signals more than 1Vp-p). Confirm the large APL change waveform (100% white signals more than 1Vp-p) and evaluate sufficiently.

■ APPLICATION CIRCUIT (in case DC-coupling)

Note)
0.5V is always output from Vout.
