# 1 Overview

## 1.1 Features

- 184-pin Unbuffered 8-Byte Dual-In-Line DDR SDRAM non-parity and ECC-Modules for PC and Server main memory applications
- One rank 16M x 64, 16M x 72 and two rank 32M x 64, 32M x 72 organization
- JEDEC standard Double Data Rate Synchronous DRAMs (DDR SDRAM) Single + 2.5 V ( $\pm 0.2$  V) power supply
- Built with 128 Mb DDR SDRAMs organised as 16Mb x 8 in 66-Lead TSOPII package
- Programmable CAS Latency, Burst Length, and Wrap Sequence (Sequential & Interleave)
- Auto Refresh (CBR) and Self Refresh
- All inputs and outputs SSTL\_2 compatible
- Serial Presence Detect with E<sup>2</sup>PROM
- JEDEC standard MO-206 form factor:  
133.35 mm x 31.75 mm x 4.00 mm max.
- JEDEC standard reference layout
- Gold plated contacts

## 1.2 Description

The HYS64/72D16000GU and HYS64/72D32020GU are industry standard 184-pin 8-byte Dual in-line Memory Modules (DIMMs) organized as 16M x 64 and 32M x 64 for non-parity and 16M x 72 and 32M x 72 for ECC main memory applications. The memory array is designed with 128Mbit Double Data Rate Synchronous DRAMs. A variety of decoupling capacitors are mounted on the PC board. The DIMMs feature serial presence detect based on a serial E<sup>2</sup>PROM device using the 2-pin I<sup>2</sup>C protocol. The first 128 bytes are programmed with configuration data and the second 128 bytes are available to the customer.

HYS72D32020GU-8-A	PC1600-20220-B1	two ranks 256 MB ECC-DIMM	128 MBit (x8)

*Note: All part numbers end with a place code, designating the silicon-die revision. Reference information available on request. Example: HYS 72D32020GU-8-A, indicating Rev.A dies are used for the SDRAM components. The Compliance Code is printed on the module labels and describes the speed sort fe. "PC2100", the latencies (f.e. "20330" means CAS latency = 2, trcd latency = 3 and trp latency =3 ) and the Row Card used for this module.*

Voltage on $V_{DDQ}$ supply relative to $V_{SS}$	$V_{DDQ}$	-1	–	+3.6	V	–
Operating temperature (ambient)	$T_A$	0	–	+70	°C	–
Storage temperature (plastic)	$T_{STG}$	-55	–	+150	°C	–
Power dissipation (per SDRAM component)	$P_D$	–	1	–	W	–
Short circuit output current	$I_{OUT}$	–	50	–	mA	–

**Attention:** Permanent damage to the device may occur if “Absolute Maximum Ratings” are exceeded. This is a stress rating only, and functional operation should be restricted to recommended operation conditions. Exposure to absolute maximum rating conditions for extended periods of time may affect device reliability and exceeding only one of the values may cause irreversible damage to the integrated circuit.

1)  $0^\circ C \leq T_A \leq 70^\circ C$

2) Under all conditions,  $V_{DDQ}$  must be less than or equal to  $V_{DD}$ .

3) Peak to peak AC noise on  $V_{REF}$  may not exceed  $\pm 2\% V_{REF(DC)}$ .  $V_{REF}$  is also expected to track noise variations in  $V_{DDQ}$ .

4)  $V_{TT}$  is not applied directly to the device.  $V_{TT}$  is a system supply for signal termination resistors, is expected to be set equal to  $V_{REF}$ , and must track variations in the DC level of  $V_{REF}$ .

5)  $V_{ID}$  is the magnitude of the difference between the input level on CK and the input level on  $\overline{CK}$ .

6) The ratio of the pull-up current to the pull-down current is specified for the same temperature and voltage, over the entire temperature and voltage range, for device drain to source voltage from 0.25 to 1.0 V. For a given output, it represents the maximum difference between pull-up and pull-down drivers due to process variation.

7) Inputs are not recognized as valid until  $V_{REF}$  stabilizes.

8) Values are shown per component

- 1) Module  $I_{DD}$  values are calculated on the basis of component  $I_{DD}$  and can be measured differently according to DQ loading capacity.
- 2) Test condition for maximum values:  $V_{DD} = 2.7 \text{ V}$ ,  $T_A = 10 \text{ °C}$
- 3) The module  $I_{DDx}$  values are calculated from the  $I_{DDx}$  values of the component data sheet as follows:  
 $m \times I_{DDx}[\text{component}] + n \times I_{DD3N}[\text{component}]$  with  $m$  and  $n$  number of components of rank 1 and 2;  $n=0$  for 1 rank modules
- 4) DQ I/O ( $I_{DDQ}$ ) currents are not included in the calculations (see note 1)
- 5) The module  $I_{DDx}$  values are calculated from the component  $I_{DDx}$  data sheet values as:  $(m + n) \times I_{DDx}[\text{component}]$

- 1)  $0\text{ }^{\circ}\text{C} \leq T_A \leq 70\text{ }^{\circ}\text{C}$ ;  $V_{DDQ} = 2.5\text{ V} \pm 0.2\text{ V}$ ,  $V_{DD} = +2.5\text{ V} \pm 0.2\text{ V}$
- 2) Input slew rate  $\geq 1\text{ V/ns}$  for DDR266, and =  $1\text{ V/ns}$  for DDR200
- 3) The CK/ $\overline{\text{CK}}$  input reference level (for timing reference to CK/ $\overline{\text{CK}}$ ) is the point at which CK and  $\overline{\text{CK}}$  cross: the input reference level for signals other than CK/ $\overline{\text{CK}}$ , is  $V_{REF}$ . CK/ $\overline{\text{CK}}$  slew rate are  $\geq 1.0\text{ V/ns}$ .
- 4) Inputs are not recognized as valid until  $V_{REF}$  stabilizes.
- 5) The Output timing reference level, as measured at the timing reference point indicated in AC Characteristics (note 3) is  $V_{TT}$ .
- 6) These parameters guarantee device timing, but they are not necessarily tested on each device.
- 7)  $t_{HZ}$  and  $t_{LZ}$  transitions occur in the same access time windows as valid data transitions. These parameters are not referred to a specific voltage level, but specify when the device is no longer driving (HZ), or begins driving (LZ).
- 8) The specific requirement is that DQS be valid (HIGH, LOW, or some point on a valid transition) on or before this CK edge. A valid transition is defined as monotonic and meeting the input slew rate specifications of the device. When no writes were previously in progress on the bus, DQS will be transitioning from Hi-Z to logic LOW. If a previous write was in progress, DQS could be HIGH, LOW, or transitioning from HIGH to LOW at this time, depending on  $t_{DQSS}$ .
- 9) The maximum limit for this parameter is not a device limit. The device operates with a greater value for this parameter, but system performance (bus turnaround) degrades accordingly.

## Electrical Characteristics

- 10) Fast slew rate  $\geq 1.0$  V/ns , slow slew rate  $\geq 0.5$  V/ns and  $< 1$  V/ns for command/address and CK &  $\overline{\text{CK}}$  slew rate  $> 1.0$  V/ns, measured between  $V_{\text{OH(ac)}}$  and  $V_{\text{OL(ac)}}$ .
- 11) CAS Latency 1.5 operation is supported on DDR200 devices only
- 12)  $t_{\text{RPRES}}$  is defined for CL = 1.5 operation only
- 13) For each of the terms, if not already an integer, round to the next highest integer.  $t_{\text{CK}}$  is equal to the actual system clock cycle time.
- 14) A maximum of eight Autorefresh commands can be posted to any given DDR SDRAM device.
