

ACE93C46.56.66 Three-wire Serial EEPROM

Description

The ACE93C46/56/66 provides 1024/2048/4096 bits of serial electrically erasable programmable read only memory (EEPROM) organized as 64/128/256 words of 16 bits each, when the ORG pin is connected to VCC and 128/256/512 words of 8 bits each when it is tied to ground. The ACE93C46/56/66 is available in space-saving 8-lead PDIP, 8-lead TSSOP and 8-lead JEDEC SOIC packages. The ACE93C46/56/66 is enabled through the Chip Select pin (CS), and accessed via a 3-wire serial interface consisting of Data Input (DI), Data Output (DO), and Shift Clock (SK). Upon receiving a Read instruction at DI, the address is decoded and the data is clocked out serially on the data output pin DO. The WRITE cycle is completely self-timed and no separate erase cycle is required before write. The Write cycle is only enabled when it is in the Erase/Write Enable state. When CS is brought “high” following the initiation of a write cycle, the DO pin outputs the Ready/Busy status.

Features

- Low-voltage operation – 1.8 (VCC=1.8V to 5.5V)
- Three-wire serial Interface
- 2MHz clock rate(5V) compatibility
- Self-timed write cycle (5 ms max)
- High-reliability – Endurance: 1 Million write cycles
Data retention: 100 Years

Packaging Type

Pin Configurations

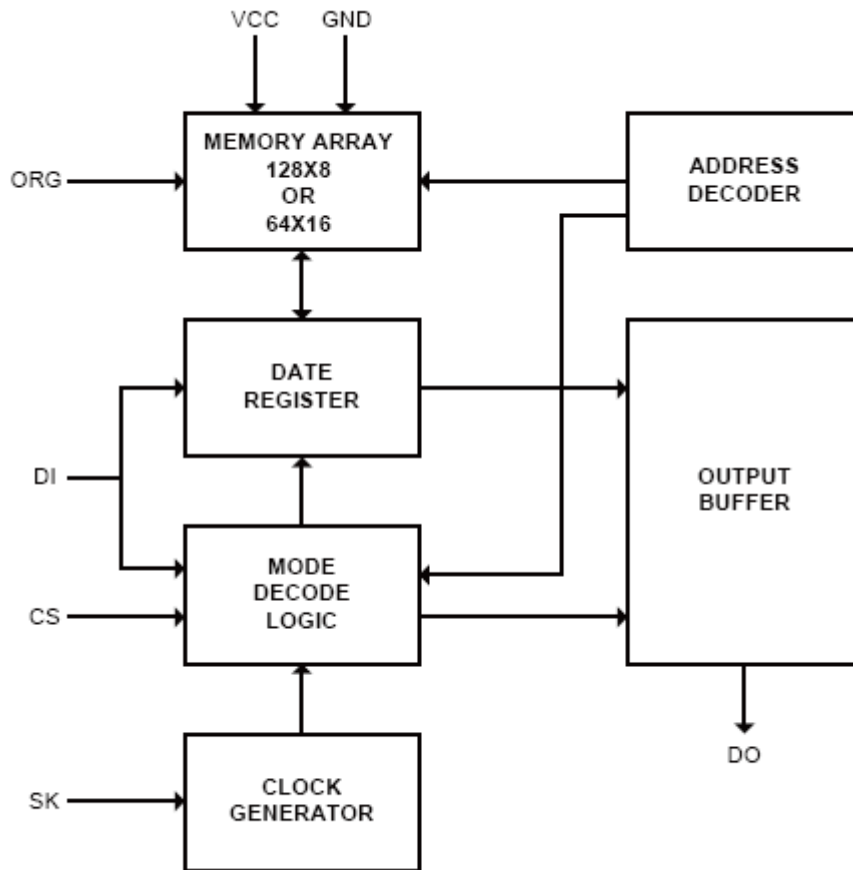

Pin Name	Function
CS	Chip select
SK	Serial Data Clock
DI	Serial Data Input
DO	Serial Data Output
GND	Ground
Vcc	Power Supply
ORG	Internal Organization
DC	Don't Connect

ACE93C46.56.66 Three-wire Serial EEPROM

Block Diagram

ACE93C46

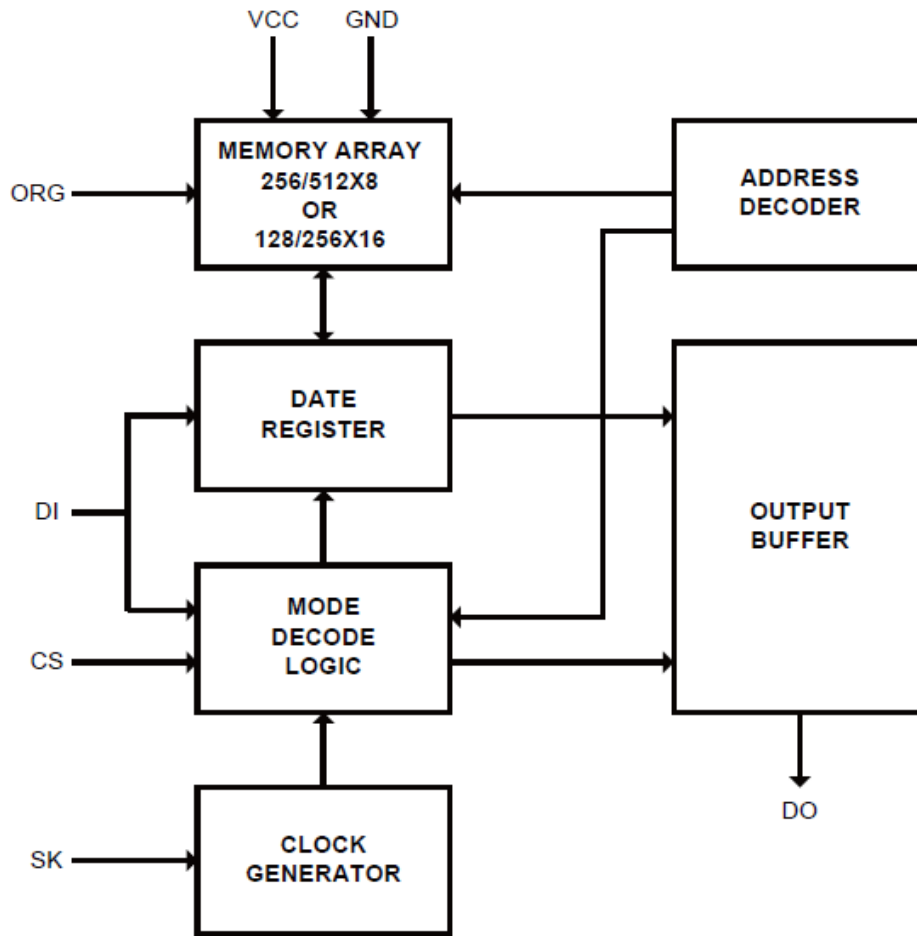

Note: When the ORG pin is connected to VCC, the "x 16" organization is selected. When it is connected to ground, the "x 8" organization is selected. If the ORG pin is left unconnected and the application does not load the input beyond the capability of the internal 1 Meg ohm pullup, then the "x 16" organization is selected.

ACE93C46.56.66 Three-wire Serial EEPROM

ACE93C56/66

Note: When the ORG pin is connected to VCC, the “x 16” organization is selected. When it is connected to ground, the “x 8” organization is selected. If the ORG pin is left unconnected and the application does not load the input beyond the capability of the internal 1 Meg ohm pullup, then the “x 16” organization is selected.

Absolute Maximum Ratings

DC Supply Voltage	-0.3 to 6.5V
Input / Output Voltage	GND -0.3 to Vcc 0.3V
Operating Ambient Temperature	-40 to 85°C
Storage Temperature	-65 to 150°C

*Notice: Stresses above those listed under “Absolute Maximum Ratings” may cause permanent damage to this device. These are stress ratings only. Functional operation of this device at these or any other conditions above those indicated in the operational sections of this specification is not implied or intended. Exposure to the absolute maximum rating conditions for extended periods may affect device reliability.

Note: 1. This parameter is characterized and is not 100% tested.

Functional Description

The ACE93C46/56/66 is accessed via a simple and versatile three-wire serial communication interface. Device operation is controlled by seven instructions issued by the host processor. A valid instruction starts with a rising edge of CS and consists of a start bit (logic "1") followed by the appropriate op code and the desired memory address location.

Instruction Set for the ACE93C46

Instruction	SB	OP Code	Address		Data		Comments
			*8	*16	*8	*16	
READ	1	10	A ₆ -A ₀	A ₅ -A ₀			Read data stored in memory, at specified address
EWEN	1	00	11XXXXX	11XXXX			Write enable must precede all programming modes
REASE	1	11	A ₆ -A ₀	A ₅ -A ₀			Erase memory location An-A0
WRITE	1	01	A ₆ -A ₀	A ₅ -A ₀	D ₇ -D ₀	D ₁₅ -D ₀	Writes memory location An-A0
ERAL	1	00	10XXXXX	10XXXX			Erases all memory locations. Valid only at VCC=4.5V to 5.5V
WRAL	1	00	01XXXXX	01XXXX	D ₇ -D ₀	D ₁₅ -D ₀	Writes all memory locations. Valid only at VCC=4.5V to 5.5V
EWDS	1	00	00XXXXX	00XXXX			Disables all programming instructions

Notes: The X's in the address field represent don't care values and must be clocked.

ACE93C46.56.66 Three-wire Serial EEPROM

Instruction Set for the ACE93C56/66

Instruction	SB	OP Code	Address		Data		Comments
			*8	*16	*8	*16	
READ	1	10	A ₈ -A ₀	A ₇ -A ₀			Read data stored in memory, at specified address
EWEN	1	00	11XXXXXX	11XXXXXX			Write enable must precede all programming modes
REASE	1	11	A ₈ -A ₀	A ₇ -A ₀			Erase memory location An-A0
WRITE	1	01	A ₈ -A ₀	A ₇ -A ₀	D ₇ -D ₀	D ₁₅ -D ₀	Writes memory location An-A0
ERAL	1	00	10XXXXXXXX	10XXXXXXXX			Erases all memory locations. Valid only at VCC=4.5V to 5.5V
WRAL	1	00	01XXXXXXXX	01XXXXXXXX	D ₇ -D ₀	D ₁₅ -D ₀	Writes all memory locations. Valid only at VCC=4.5V to 5.5V
EWDS	1	00	00XXXXXXXX	00XXXXXXXX			Disables all programming instructions

Notes: The X's in the address field represent don't care values and must be clocked.

READ (READ):

The Read (READ) instruction contains the address code for the memory location to be read. After the instruction and address are decoded, data from the selected memory location is available at the serial output pin DO. Output data changes are synchronized with the rising edges of serial clock SK. It should be noted that a dummy bit (logic "0") precedes the 8- or 16-bit data output string. The ACE93C56/66 supports sequential read operations. The device will automatically increment the internal address pointer and clock out the next memory location as long as Chip Select (CS) is held high. In this case, the dummy bit (logic "0") will not be clocked out between memory locations, thus allowing for a continuous stream of data to be read.

ERASE/WRITE (EWEN):

To assure data integrity, the part automatically goes into the Erase/Write Disable (EWDS) state when power is first applied. An Erase/Write Enable (EWEN) instruction must be executed first before any programming instructions can be carried out. Please note that once in the EWEN state, programming remains enabled until an EWDS instruction is executed or VCC power is removed from the part.

ERASE (ERASE):

The Erase (ERASE) instruction programs all bits in the specified memory location to the logical "1" state. The self-timed erase cycle starts once the ERASE instruction and address are decoded. The DO pin outputs the Ready/Busy status of the part if CS is brought high after being kept low for a minimum of 250 ns (TCS). A logic "1" at pin DO indicates that the selected memory location has been erased, and the part is ready for another instruction.

ACE93C46.56.66 Three-wire Serial EEPROM

WRITE (WRITE):

The Write (WRITE) instruction contains the 8 or 16 bits of data to be written into the specified memory location. The self-timed programming cycle, t_{WP} , starts after the last bit of data is received at serial data input pin DI. The DO pin outputs the Ready/Busy status of the part if CS is brought high after being kept low for a minimum of 250 ns (TCS). A logic “0” at DO indicates that programming is still in progress. A logic “1” indicates that the memory location at the specified address has been written with the data pattern contained in the instruction and the part is ready for further instructions. A Ready/Busy status cannot be obtained if the CS is brought high after the end of the self-timed programming cycle, TWP .

ERASE ALL (ERAL):

The Erase All (ERAL) instruction programs every bit in the memory array to the logic “1” state and is primarily used for testing purposes. The DO pin outputs the Ready/Busy status of the part if CS is brought high after being kept low for a minimum of 250 ns (TCS). The ERAL instruction is valid only at $VCC = 5.0V \pm 10\%$.

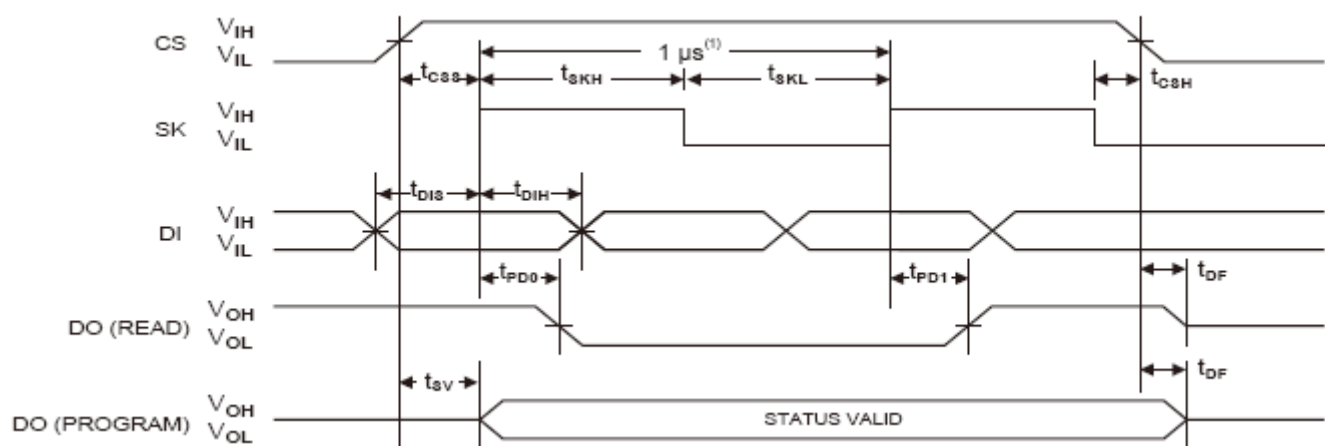

WRITE ALL (WRAL):

The Write All (WRAL) instruction programs all memory locations with the data patterns specified in the instruction. The DO pin outputs the Ready/Busy status of the part if CS is brought high after being kept low for a minimum of 250ns (TCS). The WRAL instruction is valid only at $VCC = 5.0V \pm 10\%$.

ERASE/WRITE DISABLE (EWDS):

To protect against accidental data disturb, the Erase/Write Disable (EWDS) instruction disables all programming modes and should be executed after all programming operations. The operation of the Read instruction is independent of both the EWEN and EWDS instructions and can be executed at any time.

Notes

ACE does not assume any responsibility for use as critical components in life support devices or systems without the express written approval of the president and general counsel of ACE Electronics Co., LTD. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.
