

## MSM80C35/48

## MSM80C39/49

## MSM80C40/50

### CMOS 8-BIT SINGLE CHIP MICROCONTROLLER

#### GENERAL DESCRIPTION

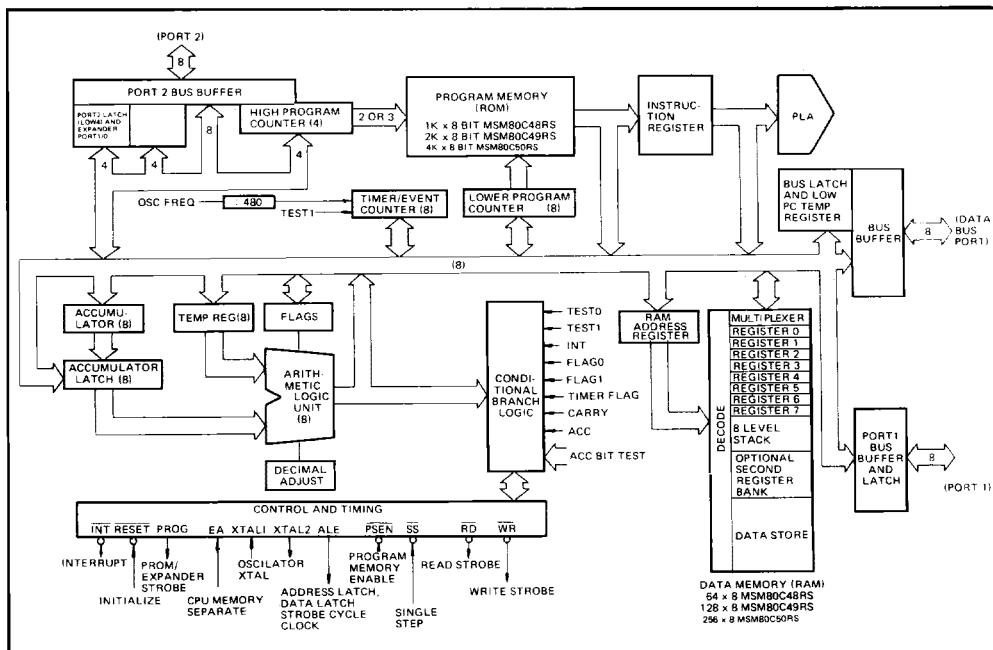

The OKI MSM80C48/MSM80C49/MSM80C50 microcontroller is a low-power, high-performance 8-bit single chip device implemented in silicon gate complementary metal oxide semiconductor technology. Integrated within these chips are 8K/16K/32K bits of mask program ROM, 512/1024/2048 bits of data RAM, 27 I/O lines, built-in 8 bit timer/counter, and oscillator. Program memory and data paths are byte wide. Eleven new instructions have been added to the NMOS version's instruction set, thereby optimizing power down, port data transfer, decrement and port float functions.

Available in 40-pin plastic DIP (RS) or 44-pin plastic flat packages (GSK).

#### FEATURES

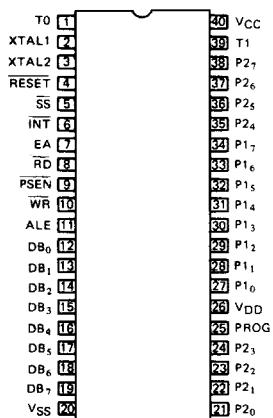

- Lower power consumption enabled by CMOS silicon gate process
- Completely static operation
- Improved power-down feature
- Minimum instruction cycle  $1.36 \mu\text{s}$  (11MHz)  
@  $V_{CC} = +5V \pm 10\%$   
11 MHz version of MSM80C40/50 (6 MHz < XTAL1.2 < 11 MHz) is under development.
- Every signal input terminal is provided with a Schmitt circuit, except XTAL1 Pin.
- Every signal output terminal is capable of driving a standard TTL, except XTAL2 Pin.
- 111 instructions
- All instructions are usable even during execution of external ROM instructions.
- Operation facility  
Addition, logical operations, and decimal adjust
- Program memory (ROM) :  $1K \times 8$  bits (MSM80C48)  
:  $2K \times 8$  bits (MSM80C49)  
:  $4K \times 8$  bits (MSM80C50)
- Data memory (RAM) :  $64 \times 8$  bits (MSM80C48)  
:  $128 \times 8$  bits (MSM80C49)  
:  $256 \times 8$  bits (MSM80C50)
- Two sets of working registers
- External and timer interrupts
- Two test inputs
- Built-in 8-bit timer counter
- Extendable external memory and I/O ports
- Input/output ports : Input/output ports
  - 8 bits  $\times 2$
  - : Data bus input/output
    - 8 bits  $\times 1$
- Single-step execution function
- Wide range of operating voltage, from +2.5V to +6V of  $V_{CC}$ .
- High noise margin action
- Compatible with Intel's 8048, 8049 and 8050
- Package:
  - 40 pin plastic DIP (DIP40-P-600)
  - 44 pin plastic QFP (QFP44-P-910-K)
  - 44 pin plastic QFP (QFP44-P-910-VK)

## FUNCTIONAL BLOCK DIAGRAM

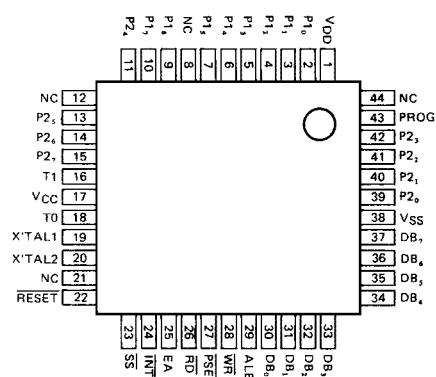

## PIN CONFIGURATION

(Top View) 40 Lead Plastic DIP

(Top View) 44 Lead Plastic FLAT

Pin Name

P1 <sub>0</sub> ~ P1 <sub>7</sub>	: Input/output port (PORT1)	ALE	: Address Latch Enable
P2 <sub>0</sub> ~ P2 <sub>7</sub>	: Input/output port (PORT2)	PSEN	: Program Store Enable
DB <sub>0</sub> ~ DB <sub>7</sub>	: Data bus port (BUS PORT)	RESET	: Reset
T0, T1	: Test	SS	: Single Step
INT	: Interrupt	EA	: ROM Mode
RD	: Read	XTAL 1, 2	: Crystal Controlled
WR	: Write		

**PIN DESCRIPTION**

Designation	Input/Output	Function
P1 <sub>0</sub> ~ P1 <sub>7</sub> (PORT 1)	Input/Output	8-bit quasi-bidirectional port
P2 <sub>0</sub> ~ P2 <sub>7</sub> (PORT 2)	Input/Output	8-bit quasi-bidirectional port The high-order four bits of external program memory addresses can be output from P20-P23, to which the I/O expander MSM82C43RS may also be connected.
DB <sub>0</sub> ~ DB <sub>7</sub> (BUS)	Input/Output	Bidirectional port The low-order eight bits of external program memory address can be output from this port, and the addressed instruction is fetched under the control of PSEN signal. Also, the external data memory address is output, and data is read and written synchronously using RD and WR signals. The port can also serve as either a statically latched output port or a non-latching input port.
T0 (Test 0)	Input/Output	The input can be tested with the conditional jump instructions JTO and JNT0. The execution of the ENTO CLK instruction causes a clock output to be generated.
T1	Input	The input can be tested with the conditional jump instructions JT1 and JNT1. The execution of a STRT CNT instruction causes an internal counter input to be activated.
INT (Interrupt)	Input	Interrupt input. If interrupt is enabled, INT input initiates an interrupt. Interrupt is disabled after a reset. Also testable with a JNI instruction. Can be used to terminate the power-down mode. (Active "0" level)
RD (Read)	Output	A signal to read data from external data memory. (Active "0" level)
WR (Write)	Output	A signal to write data to external data memory. (Active "0" level)
ALE Address & Data Latch Clock	Output	This signal is generated in each cycle. It may be used as a clock output. External data memory or external program memory is addressed upon the falling edge. For the external ROM, this signal is used to latch the bus port data upon the ALE signal rise-up after the execution of the OUTL BUS, A instruction.
PSEN Program Store Enable	Output	A signal to fetch an instruction from external program memory (Active "0" level)
RESET	Output	RESET input initialize the processor. (Active "0" level) Used to terminate the power-down mode.
SS (Single Step)	Output	A program is executed step by step. This pin can also be used to control internal oscillation when the power-down mode is reset. (Active "0" level)
EA (External Access)	Input	When held at high level, all instructions are fetched from external memory. (Active "1" level)
PROG (Expander Strobe)	Output	This output strobes the MSM82C43RS I/O expander.

## PIN DESCRIPTION (CONT.)

Designation	Input/Output	Function
XTAL 1 (Crystal 1)	Input	One side of the internal crystal oscillator. An external clock can also be input.
XTAL 2 (Crystal 2)	Output	Other side of the internal crystal oscillator.
V <sub>CC</sub>	—	Power supply terminal
V <sub>DD</sub>	—	Standby control input. Normally, "1" level. When set to "0" level, oscillation is stopped and processor goes into standby mode.
V <sub>SS</sub>	—	GND

**Note:** The required RESET pulse duration is at least two machine cycles under the condition that the power supply and the oscillator have been stabilized.

## ADDED FUNCTIONS OF MSM80C48, MSM80C49 AND MSM80C50

The MSM80C48, MSM80C49 and MSM80C50 basically incorporate the capabilities of Intel's 8048, 8049, and 8050 plus the following new functions:

### 1. Power-Down Mode Enhancements

#### 1.1 Power-down by software

- (1) Clock (See item 4, "Power-down mode", for details.)
  - a. Crystal-controlled oscillator halt (HLTS instruction)  
Power requirements can be minimized.
  - b. Clock supply halt (HALT instruction)  
Restart is accomplished without oscillator wait.
- (2) I/O ports (See Table 4-1 and 4-2 for details.)  
I/O port floating instructions  
Power consumption resulting from inputs/outputs can be minimized with FLT and FLTT instructions.  
Port floating is cancelled by executing FRES instruction, "0" level at INT pin or "0" level at RESET pin.
- (3) Six types of power-down can be done by a combination of HLTS/HALT and FLT/FLTT instructions.

#### 1.2 Power-down by hardware (See 4.3, Power-down mode by V<sub>DD</sub> pin utilization for details.)

Crystal-controlled oscillators can be halted by controlling the V<sub>DD</sub> terminal, thereby floating all I/O ports for minimum power consumption.

### 2. Additional Instructions (11)

HLTS	MOV A, P2
HALT	MOV P1, @ R3
FLT	MOVP1 P, @ R3
FLTT	DEC @ Rr
FRES	DJNZ @ R, addr
MOV A, P1	

### 3. Improved Uses of BUS P<sub>0</sub> ~ 7, P1<sub>0</sub> ~ 7, P2<sub>0</sub> ~ 7, and SS terminals

#### 3.1 BUS P<sub>0</sub> ~ 7

The MSM80C48, MSM80C49, and MSM80C50 remove the limitation on the use of OUTL BUS, A instructions during the external ROM access mode by having an independent data latch and external ROM mode address latch in BUS P<sub>0</sub> ~ 7.

Consequently, there is no need to relocate bus port instructions when in the external ROM access mode.

#### 3.2 P1<sub>0</sub> ~ 7 and P2<sub>0</sub> ~ 7

The MSM80C48, MSM80C49 and MSM80C50 are designed to minimize power consumption when P1<sub>0</sub> ~ 7 and P2<sub>0</sub> ~ 7 are used as input/output ports, to maximize the performance of CMOS.

When these ports are used as output ports, the acceleration circuit is actuated only when output data changes from "0" to "1", thus speed-

ing up the rise time of the output signals.

When these ports are used as input ports, the internal pullup resistance becomes approximately 9 kΩ when input data is "1".

The internal pullup resistance rises to approximately 100 kΩ when input data is "0". Thus, a high noise margin can be obtained by selecting the impedance and thus the outflow of current is minimized whenever these ports are used as output or input ports.

### 3.3 Clock generation control via the SS terminal

When the crystal-controlled oscillator is halted in the HLTS or hardware power-down mode, the SS terminal is pulled down by a resistor of 20 – 50 kΩ, while its internal pullup resistor of 200 – 500 kΩ is isolated from V<sub>CC</sub>. When the power-down mode is cancelled, the internal resistor of the SS terminal is changed from pull-down to pullup. Consequently, the CPU can be halted for any period of time until the crystal-controlled oscillator resumes normal oscillation when a capacitor is connected to the SS terminal.

### 4. Power-Down Mode

The MSM80C48, MSM80C49, and MSM80C50 power-down mode can be enabled in 2 different ways-through software by a combination of clock control and port floating instructions, and through hardware by control of the V<sub>DD</sub> pin.

#### 4.1 Software power-down mode

Power-down mode can be done by a combination of the following instructions.

- (1) HALT (clock supply halt to control circuit)

Instruction code:	<table border="1"><tr><td>0</td><td>0</td><td>0</td><td>0</td><td>1</td><td>0</td><td>0</td><td>1</td></tr></table>	0	0	0	0	1	0	0	1
0	0	0	0	1	0	0	1		

Description: Although crystal-controlled oscillator operation is continued, the clock supply to the CPU control circuit is halted and CPU operations suspended. When cancelling this software mode, restart is accomplished without oscillator wait. Timing charts are outlined in Figs. 4-1 and 4-2.

- (2) HLTS (oscillation stop)

Instruction code:	<table border="1"><tr><td>1</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>1</td><td>0</td></tr></table>	1	0	0	0	0	0	1	0
1	0	0	0	0	0	1	0		

Description: The oscillator operation is halted and CPU operations suspended. In cancelling this power down mode, connecting a capacitor to the SS pin enables a reasonable

wait period to be accomplished before normal operation is resumed. [Except in the case of using the RESET pin]

Timing charts are outlined in Figs. 4-3 and 4-4.

(3) **FLT** (floating P<sub>10</sub> ~ 7, P<sub>20</sub> ~ 7, and BP<sub>0</sub> ~ 7)

Instruction code:

1	0	1	0	0	0	1	0
---	---	---	---	---	---	---	---

Description:

	Internal ROM mode	External ROM mode
P1	Floating	Floating
P2	Floating	P <sub>20</sub> ~ 3 operation P <sub>24</sub> ~ 7 floating
BP	Floating	Operation

Details of IC pin status as a result of executing the FLT instruction are shown in Table 4-1.

(4) **FLTT** (floating of all output pins)

Instruction code:

1	1	0	0	0	0	1	0
---	---	---	---	---	---	---	---

Description:

	Internal ROM mode	External ROM mode
ALE	Floating	Operation
PSEN	Floating	Operation
PROG	Floating	Floating
WR	Floating	Floating
RD	Floating	Floating
TO OUT	Floating	Floating
P1	Floating	Floating
P2	Floating	P <sub>20</sub> ~ 3 operation P <sub>24</sub> ~ 7 floating
BP	Floating	Operation
XTAL	Operation	Operation

Details of IC pin status as a result of executing the FLTT instruction are shown in Table 4-2.

**Example 1:** Power-down mode accomplished by stopping oscillation.

- Setting by execution of HLTS [82H] instruction.

**Example 2:** Power-down mode accomplished by stopping the clock supply to the CPU control circuit.

- Setting by execution of HALT [01H] instruction.

**Example 3:** Power-down mode by floating of P<sub>10</sub> ~ 7, P<sub>20</sub> ~ 7 and BP<sub>0</sub> ~ 7, and subsequent stopping of CPU oscillation.

- Setting by first executing the FLT[A2H] instruction and then the HLTS[82H] instruction.

**Example 4:** Power-down mode by floating P<sub>10</sub> ~ 7, P<sub>20</sub> ~ 7 and BP<sub>0</sub> ~ 7, and then stopping the clock supply to the CPU control circuit.

- Setting by first executing the FLT[A2H] instruction, and then the HALT[01H] instruction.

**Example 5:** Power-down mode by floating all output pins, followed by stopping oscillation.

- Setting by first executing the FLTT[C2H] instruction followed by execution of the HLTS[82H] instruction.

**Example 6:** Power-down mode by floating all output pins, followed by stopping of the clock supply to the CPU control circuit.

- Setting by first executing the FLTT[C2H] instruction, followed by execution of the HALT[01H] instruction.

#### 4.2 Cancellation of software power-down mode

The power-down mode status outlined above in examples 1 to 6 can be cancelled by using either the interrupt pin or the RESET pin.

(1) Use of the INT pin during external interrupt enabled mode (i.e. following execution of ENI instruction).

○ The clock generator is activated and the CPU started up when a "0" level is applied to the INT pin. If this "0" level is maintained until at least 2 ALE output signals occur, an external interrupt is generated, and execution proceeds from address 3. If, however, the power-down mode has been done during the interrupt processing routine, execution is resumed just after the power-down instruction.

(2) Use of the INT pin during external interrupt disabled mode (i.e. following execution of DISI instruction or hardware reset)

○ The clock generator is activated and the CPU started up when a "0" level is applied to the INT pin. If this "0" level is maintained until at least 2 ALE output signals occur, execution is resumed just after the power-down instruction.

(3) Use of the RESET pin

○ The clock generator is activated and the CPU started up when a "0" level is applied to the RESET pin. If this "0" level is maintained until at least 2 ALE output signals occur, the CPU is reset and execution proceeds from address 0. In case cancellation is done in oscillation stop mode, the "0" level must be input to the RESET PIN until oscillation is stabilized.

**Table 4-1 Details of Pin Status Following Execution of FLT Instruction**

Pin No.	Pin Name	Internal ROM	External ROM
1P	T0	Active	Active
2P	XTAL1	Active	Active
3P	XTAL2	Active	Active

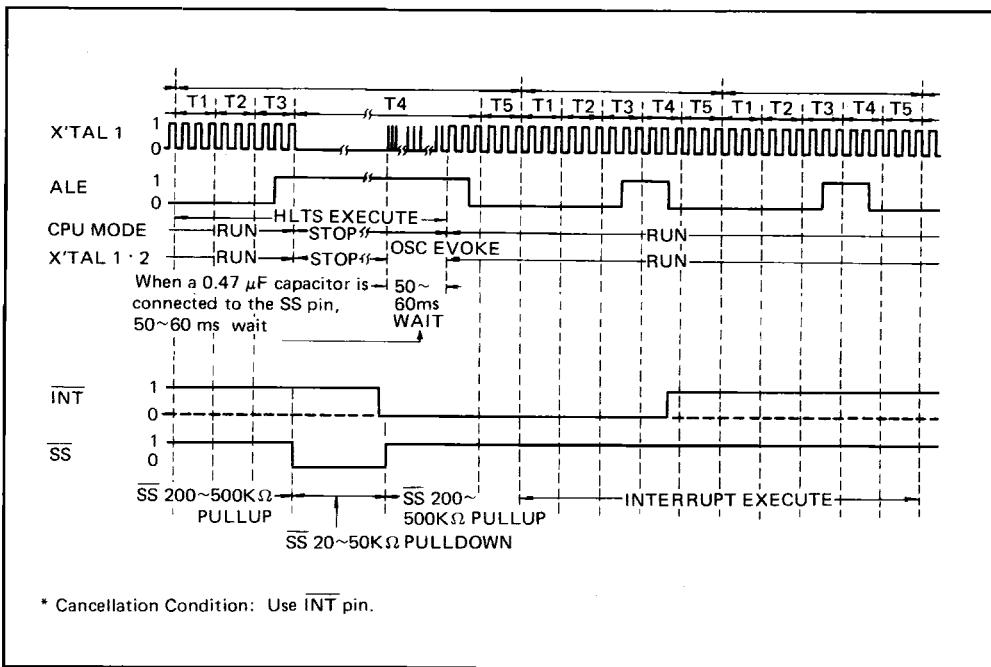

Fig. 4-4 HLTS [82H] Instruction Execution Timing Chart

#### 4.3 Hardware power-down mode

In the MSM80C48, MSM80C49 and MSM80C50, forcing the level at the V<sub>DD</sub> pin [pin 26] to a "0" during either external ROM or internal ROM mode results in suspension of the oscillator function and subsequent floating (high impedance) of all the I/O pins except the RESET, SS and XTAL 1/2 pins. The CPU is thereby stopped while maintaining internal status. Details of the IC pin status at this time are outlined in Table 4-3.

#### 4.4 Cancellation of hardware power-down mode

##### (1) Use of RESET pin

- The clock generator is activated and the CPU started up when a "1" level is applied to the V<sub>DD</sub> pin while a "0" level is input to the RESET pin. If this "0" level is kept applied to the RESET pin until oscillation become stable, the CPU will be reset and will start executing from address 0. The timing chart is outlined in Fig. 4-5.
- (2) Use of the INT pin during external interrupt enabled status (i.e. following execution of EN I instruction)
- The clock generator is activated and the CPU started up when a "1" level is applied to the V<sub>DD</sub> pin while a "0" level is applied to the INT pin.

If this "0" level is maintained until at least 2 ALE output signals occur, an external interrupt is generated, and execution starts from address 3.

However, if the power-down mode is started during an interrupt processing routine, execution will be continued on the next instruction after the present instruction. The timing chart is outlined in Fig. 4-6.

- (3) Use of the INT pin during external interrupt disabled mode (i.e. following execution of DIS I instruction or hardware reset)
  - The clock generator is activated and the CPU started up when a "1" level is applied to the V<sub>DD</sub> pin while a "0" level is applied to the INT pin. If this "0" level is maintained until at least 2 ALE output signals occur, execution is continued on the next instruction after the present instruction. The timing chart is outlined in Fig. 4-6.
- (4) Use of V<sub>DD</sub> pin only
  - The clock generator is activated and the CPU started up when a "1" level is applied to the V<sub>DD</sub> pin while a "1" level is also applied to both the RESET and INT pins. In this case, execution is resumed from the stopped position. The timing chart is outlined in Fig. 4-7.

**Table 4-3 Details of Pin Status during Hardware Power-Down Mode**

Pin No.	Pin Name	Normal Operation (V <sub>DD</sub> = "1" level)	Power Down Mode (V <sub>DD</sub> = "0" level)

## EXPLANATION OF INSTRUCTION SYMBOLS

Symbols are listed below.

A	: Accumulator	PC	: Program counter
AC	: Auxiliary carry	Pp	: Port indicator ( $p = 4 \sim 7$ )
addr	: 12-bit program memory address or its part	PSW	: Program status word
Bb	: Bit indicator ( $b = 0 \sim 7$ )	Rr	: Register indicator ( $r = 0 \sim 7$ )
BS	: Bank switch	SP	: Stack pointer
BUS	: BUS PORT	T	: Timer
C	: Carry	TF	: Timer flag
CLK	: Clock	T0, T1	: Test pins T0 and T1
CNT	: Counter	X	: External RAM
D	: 4-bit data	#	: Symbol denoting immediate data
data	: 8-bit numerical value	@	: Symbol denoting indirect address

## ABSOLUTE MAXIMUM RATINGS

Parameter	Symbol	Conditions	Limits	Unit
Supply Voltage	$V_{CC}$	$T_a = 25^\circ C$	-0.3 to 7	V
Input Voltage	$V_I$	$T_a = 25^\circ C$	-0.3 to $V_{CC}$	V
Storage Temperature	$T_{stg}$		-55 to +150	°C

## OPERATING RANGE

- MSM80C35/48, 80C39/49 ... DC to 11 MHz,  $V_{CC} = 5V \pm 10\%$
- MSM80C40/50 ... DC to 6 MHz,  $V_{CC} = 5V \pm 20\%$

Parameter	Symbol	Conditions	Limits	Unit
Supply Voltage	$V_{CC}$	$f_{osc} = DC \sim 11 \text{ MHz}^*$	+2.5 to +6	V
RAM Retention Voltage	$V_{CC}$		+2 to +6	V
Ambient Temperature	$T_A$		-40 to +85	°C
Fan Out	N	MOS load	10	
		TTL load	1	

\* 11 MHz version of MSM80C40/50 (6 MHz < XTAL1.2 < 11 MHz) is under development.

## DC ELECTRICAL CHARACTERISTICS

( $V_{CC} = 5V \pm 10\%$ ,  $T_a = -40$  to  $+85^\circ C$ )

Parameter	Symbol	Conditions	Min.	Typ.	Max.	Unit	Measuring Circuit
"L" Input Voltage	$V_{IL}$		-0.5		$0.13V_{CC}$	V	1
"H" Input Voltage (1)	$V_{IH}$		$0.4V_{CC}$		$V_{CC}$	V	
"H" Input Voltage (2)	$V_{IH}$		$0.7V_{CC}$		$V_{CC}$	V	
"L" Output Voltage (3)	$V_{OL}$	$I_{OL} = 2$ mA			0.45	V	
"L" Output Voltage (4)	$V_{OL}$	$I_{OL} = 1.6$ mA			0.45	V	
"H" Output Voltage (3)	$V_{OH}$	$I_{OH} = -400$ $\mu A$	$0.75V_{CC}$			V	
"H" Output Voltage (4)	$V_{OH}$	$I_{OH} = -50$ $\mu A$	$0.75V_{CC}$			V	
"H" Output Voltage (3)	$V_{OH}$	$I_{OH} = -20$ $\mu A$	$0.93V_{CC}$			V	
"H" Output Voltage (4)	$V_{OH}$	$I_{OH} = -10$ $\mu A$	$0.93V_{CC}$			V	
Input Leak Current	$I_{IL}$	$V_{SS} \leq V_{IN} \leq V_{CC}$			$\pm 5$	$\mu A$	2
Output Leak Current (5)	$I_{OL}$	$V_{SS} \leq V_O \leq V_{CC}$			$\pm 5$	$\mu A$	3
RESET Input current	$I_R$	$V_{IN} = V_{IH}$	-20	-50	-80	$\mu A$	2
		$V_{IN} = V_{IL}$	-3	-8	-15	$\mu A$	
SS Input current (6)	$I_{SS}$	Pull-up ( $V_{IN} = V_{IL}$ )	-4	-15	-25	$\mu A$	
		Pull-down ( $V_{IN} = V_{IH}$ )	20	70	125	$\mu A$	
P1, P2 Input current	$I_{P1}, I_{P2}$	$V_{IN} = V_{IH}$	-300	-600	-900	$\mu A$	2
		$V_{IN} = V_{IL}$	-10	-40	-80	$\mu A$	
Power Down Mode Standby Current	$I_{CCS}$	At hardware power down (7) $T_a = 25^\circ C, V_{CC} = 2.0V$	—	—	10	$\mu A$	4
		At HLTS execution (7) $T_a = 25^\circ C, V_{CC} = 2.0V$	—	—	10	$\mu A$	
Power Supply Current (Halt Mode)	$I_{CC}$	$V_{CC} = 4.5V, f = 1$ MHz	—	—	0.8	$mA$	
		$V_{CC} = 4.5V, f = 6$ MHz	—	—	1.5	$mA$	
		$V_{CC} = 4.5V, f = 11$ MHz (8)	—	—	2.5	$mA$	
		$V_{CC} = 5V, f = 1$ MHz	—	—	1.0	$mA$	
		$V_{CC} = 5V, f = 6$ MHz	—	—	2.0	$mA$	
		$V_{CC} = 5V, f = 11$ MHz (8)	—	—	3.0	$mA$	
		$V_{CC} = 5.5V, f = 1$ MHz	—	—	1.3	$mA$	
		$V_{CC} = 5.5V, f = 6$ MHz	—	—	2.5	$mA$	
		$V_{CC} = 5.5V, f = 11$ MHz (8)	—	—	4.0	$mA$	
		$V_{CC} = 4.5V, f = 1$ MHz	—	—	2.0	$mA$	
Power Supply Current	$I_{CC}$	$V_{CC} = 4.5V, f = 6$ MHz	—	—	6.5	$mA$	4
		$V_{CC} = 4.5V, f = 11$ MHz (8)	—	—	13	$mA$	
		$V_{CC} = 5V, f = 1$ MHz	—	—	2.5	$mA$	
		$V_{CC} = 5V, f = 6$ MHz	—	—	7.5	$mA$	
		$V_{CC} = 5V, f = 11$ MHz (8)	—	—	15	$mA$	
		$V_{CC} = 5.5V, f = 1$ MHz	—	—	4.0	$mA$	
		$V_{CC} = 5.5V, f = 6$ MHz	—	—	9.0	$mA$	
		$V_{CC} = 5.5V, f = 11$ MHz (8)	—	—	18	$mA$	

Notes: (1) This does not apply to  $\overline{RESET}$ , XTAL1, XTAL2, and  $V_{DD}$ .

(2)  $\overline{RESET}$ , XTAL1, XTAL2,  $V_{DD}$

(3) BUS, RD, WR, PSEN, ALE

(4) Other outputs

(5) High-impedance state

(6) This operates as a pull-down resistor when the oscillation is stopped in the HLTS or hardware power-down mode and as a pull-up resistor in other states.

(7) This does not contain flow out current from I/O Ports and Signal pins.

(8) MSM80C35/48, 80C39/49

## AC CHARACTERISTICS

( $V_{CC} = 5V \pm 10\%$ ,  $TA = -40^{\circ}\text{C}$  to  $+85^{\circ}\text{C}$ )

Parameter	Symbol	Limits				Unit	
		11 MHz Clock		Variable Clock (0 – 11 MHz)			
		Min.	Max.	Min.	Max.		
Cycle Time	$t_{CY}$	1.36		1.36		$\mu\text{s}$	
ALE Pulse Width	$t_{LL}$	150		7/30 $t_{CY}$ –165		ns	
Address Set up ALE	$t_{AL}$	70		2/15 $t_{CY}$ –110		ns	
Address Hold from ALE	$t_{LA}$	50		1/15 $t_{CY}$ –40		ns	
Bus Port Latch Data Setup to ALE	$t_{BL}$	110		5/30 $t_{CY}$ –115		ns	
Bus Port Latch Data Hold from ALE	$t_{LB}$	90		3/30 $t_{CY}$ –45		ns	
Control Pulse Width (PSEN, RD, and WR)	$t_{CC}$	300		6/15 $t_{CY}$ –245		ns	
Data Setup before WR	$t_{DW}$	250		6/15 $t_{CY}$ –295		ns	
Data Hold after WR	$t_{WD}$	40		2/15 $t_{CY}$ –140		ns	
Data Hold after RD	$t_{DR}$	0	100	0	100	ns	
PSEN, RD to Data-in	$t_{RD}$		200		5/15 $t_{CY}$ –250	ns	
Address Setup to WR	$t_{AW}$	200		6/15 $t_{CY}$ –345		ns	
Address Setup to Data-in	$t_{AD}$		400		8/15 $t_{CY}$ –325	ns	
Address Float to RD, PSEN	$t_{AFC}$	0		0		ns	
Port Control Setup to PROG	$t_{CP}$	100		2/15 $t_{CY}$ –80		ns	
Port Control Hold from PROG	$t_{PC}$	60		4/15 $t_{CY}$ –300		ns	
PROG to P2 Input Valid	$t_{PR}$	–	650		9/15 $t_{CY}$ –165	ns	
Output Data Setup	$t_{DP}$	200		6/15 $t_{CY}$ –345		ns	
Output Data Hold	$t_{PD}$	20		3/15 $t_{CY}$ –250		ns	
Input Data Hold from PROG	$t_{PF}$	0	150	0	150	ns	
PROG Pulse Width	$t_{PP}$	700		10/15 $t_{CY}$ –205		ns	
Port 2 I/O Setup to ALE	$t_{PL}$	150		9/30 $t_{CY}$ –255		ns	
Port 2 I/O Hold from ALE	$t_{LP}$	20		3/30 $t_{CY}$ –115		ns	

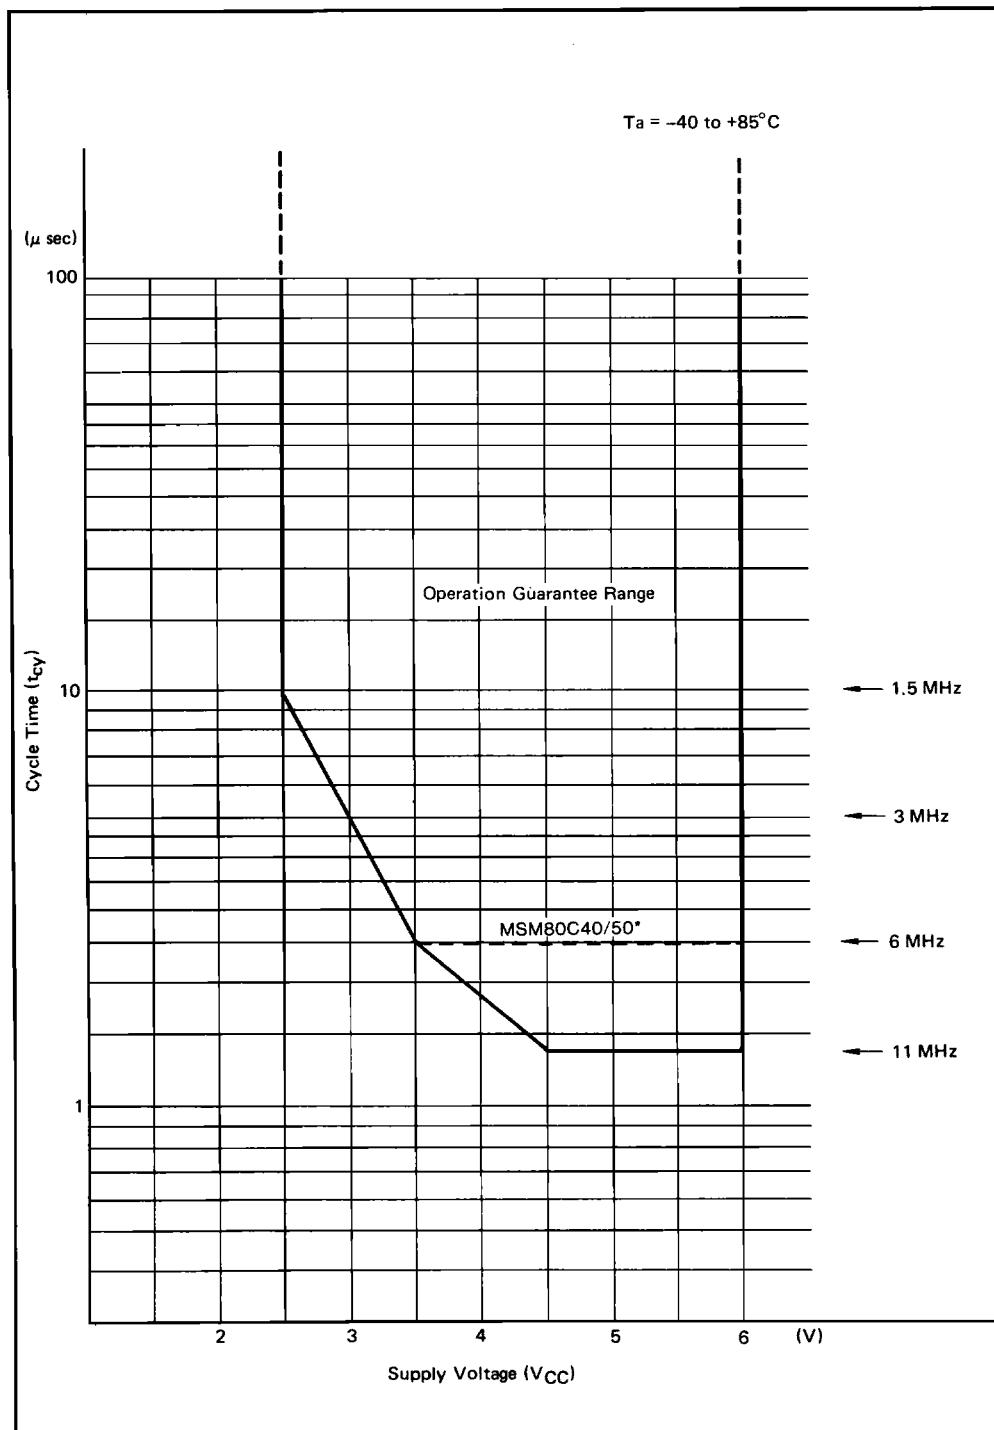

**Note:** Control output:

Bus output:

$$C_L = 80 \text{ pF}$$

$$C_L = 150 \text{ pF} [\text{for } 20 \text{ pF } (t_{WD})]$$

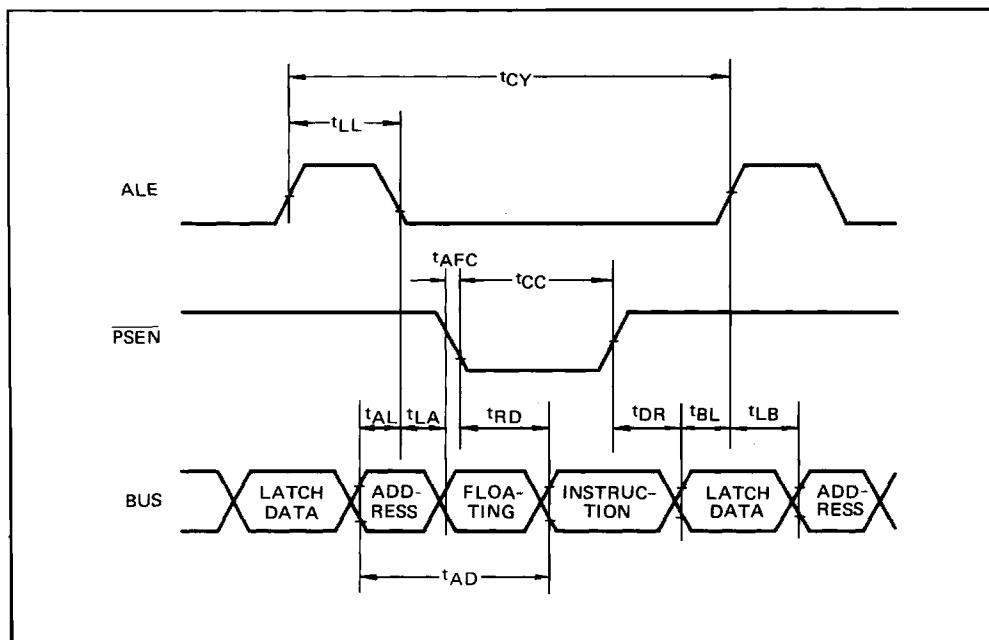

## MSM80C49 OPERATION GUARANTEE RANGE

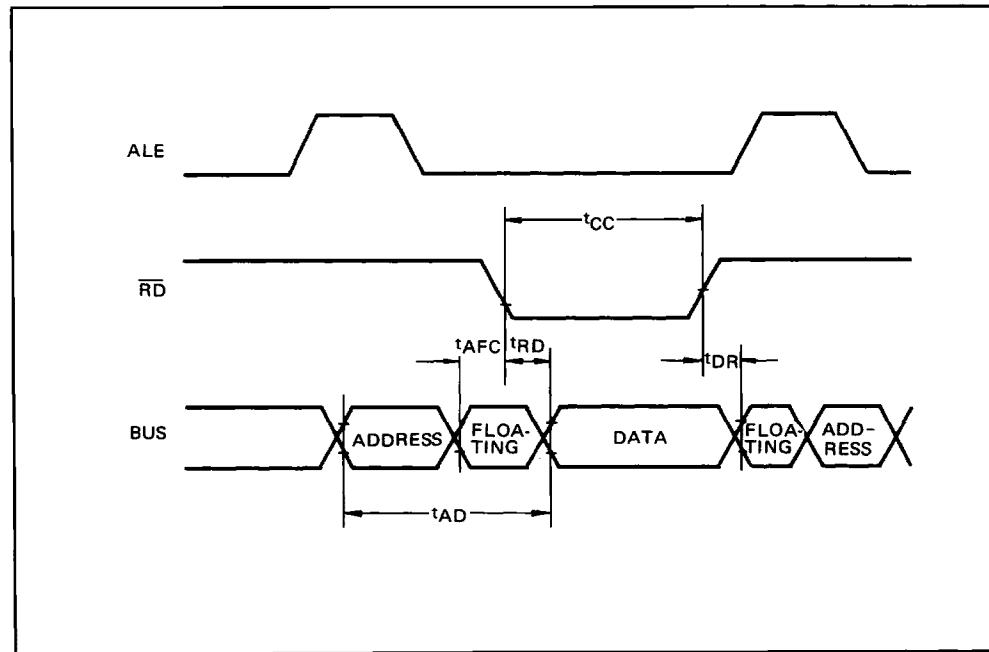

\* 11 MHz version of MSM80C40/50 is under development

## TIMING CHART

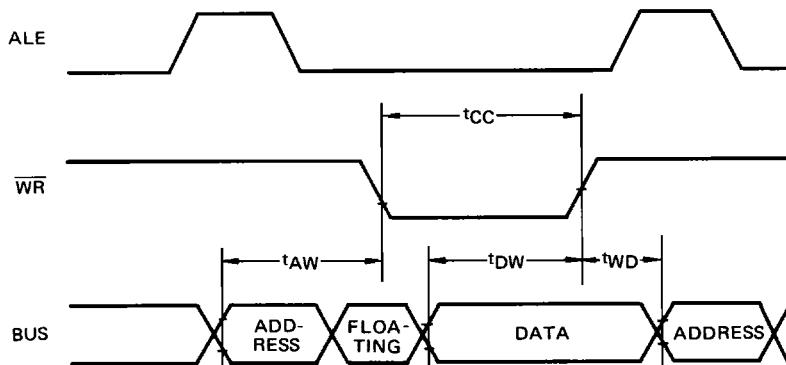

Instruction Fetch (from external program memory)

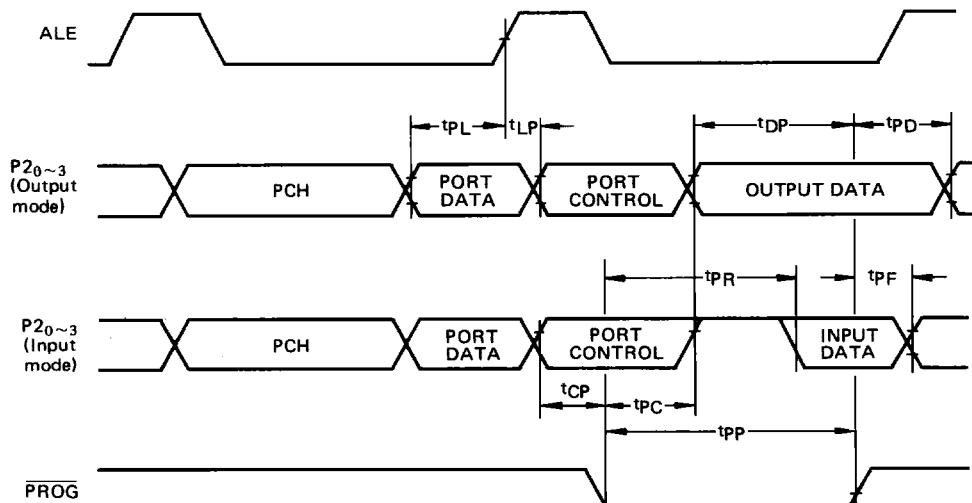

Read (from external data memory)

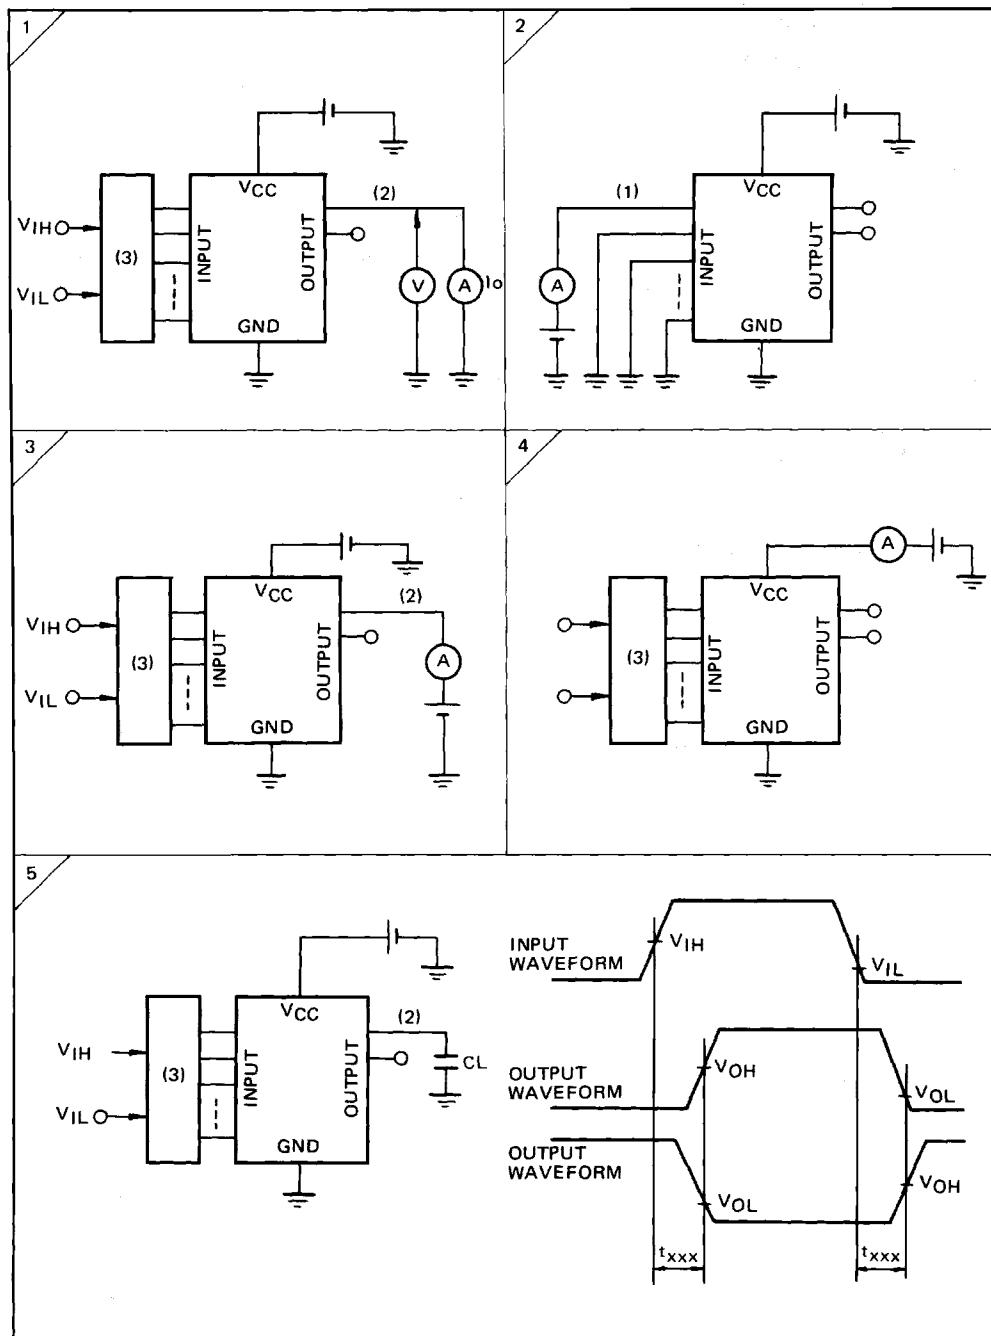

**Write (to external memory)**

**4 low-order bits input/output of port 2 when expanded I/O is used  
(in external program memory access mode)**

## MEASUREMENT CIRCUIT

**Notes:** (1) This is repeated for each specified input pin.

(2) This is repeated for each specified output pin.

(3) Input logic for setting the specified state.
