### 2. Absolute maximum ratings

(GND = 0 V)

Parameter	Symbol	Values		Unit	Remark
		Min.	Max.		
Power voltage	V <sub>CC</sub>	-0.3	5.5	V <sub>DC</sub>	At 25°C
Input signal voltage	V <sub>LH</sub>	-0.3	3.6	V <sub>DC</sub>	At 25°C
Operating temperature	T <sub>OP</sub>	0	+50	°C	Note 1
Storage temperature	T <sub>ST</sub>	-20	+70	°C	Note 1

Note 1: The relative humidity must not exceed 90% *non-condensing* at temperatures of 40°C or less. At temperatures greater than 40°C, the wet bulb temperature must not exceed 39°C. When operate at low temperatures, the brightness of CCFL will drop and the lifetime of CCFL will be reduced.

Note 2: The unit should not be exposed to corrosive chemicals.

3. Electrical characteristics

a. Typical operating conditions

	Item	Symbol	Min.	Typ.	Max.	Unit	Remark

Internal logic	Low voltage	$V_{IL}$	0	-	1.0	V	
	High voltage	$V_{IH}$	2.3	-	3.3	V	

Note 1: Effective value (mArms) at  $V_{CC} = 5\text{ V}/25^\circ\text{C}$ .

Note 2: Refer to the following power-on condition.

Sequence of Power-on/off and signal-on/off

Apply the lamp voltage within the LCD operating range. When the backlight turns on before the LCD operation or the LCD turns off before the backlight turns off, the display may momentarily become abnormal.

**Caution**

The above on/off sequence should be applied to avoid abnormal function in the display.

In case of handling:

Make sure to turn off the power when you plug the cable into the input connector or pull the cable out of the connector.

## e. Backlight unit

The backlight system is an edge-lighting type with a CCFT(Cold Cathode Fluorescent Tube).

The characteristics of a single lamp are shown in the following tables.

Parameter	Symbol	Min.	Typ.	Max.	Unit	Remark
Lamp voltage	$V_L$	720	800	880	Vrms	Note 1
Lamp current	$I_L$	4	6.5	7	mArms	Note 1
Power consumption	$P_L$	-	5.2x6	-	W	Note 2
Lamp starting voltage	$V_S$	-	-	1500(T=0°C)	Vrms	Note 3
		-	-	1150(T=25°C)		
Frequency	$F_L$	40	52	60	KHz	Note 4
Lamp life time	$L_L$	50000	-	-	Hr	Note 1, 5

Note 1: T= 25°C

Note 2: Inverter should be designed with the characteristic of lamp. When you are designing the inverter, the output voltage of the inverter should comply with the following conditions.

- (1). The area under the positive and negative cycles of the waveform of the lamp current and lamp voltage should be area symmetric (the symmetric ratio should be larger than 90%).
- (2). There should not be any spikes in the waveform.
- (3). The waveform should be sine wave as possible.
- (4). Lamp current should not exceed the maximum value within the operating temperature (It is prohibited to over the maximum lamp current even if operated in the non-guaranteed temperature). When lamp current over the maximum value for a long time, it may cause fire. Therefore, it is recommend that the inverter should have the current limited circuit.

Note 3: The inverter open voltage should be designed larger than the lamp starting voltage at T=0°C, otherwise backlight may be blinking for a moment after turning on or not be able to turn on. The open voltage should be measured after ballast capacitor. If an inverter has shutdown function it should keep its open voltage for longer than 1 second even if lamp connector is open.

Note 4: Lamp frequency may produce interference with horizontal synchronous frequency and this may cause line flow on the display. Therefore lamp frequency shall be detached from the horizontal synchronous frequency and its harmonics as far as possible in order to avoid interference.

Note 5: Brightness ( $I_L= 6.5mA$ ) to be decrease to the 50% of the initial value.

Note 6: CN2 connector (backlight): BHSR-02VS-1 (JST)

Mating connector: SM02B-BHS-1-TB (JST)

Color Saturation (NTSC)				72		%	
White uniformity	$\delta_w$		70	-	-	%	Note 3,9

Note 1: Ambient temperature = 25°C.

Note 2: To be measured in dark room after backlight warm up 30 minutes.

Note 3: To be measured with a viewing cone of 1° by Topcon luminance meter ELDIM EZContrast 160D.

Note 4: To be measured with the detector PR880

Note 5: Definition of response time:

The output signals of BM-7 are measured when the input signals are changed from "Black" to "White" (falling time) and from "White" to "Black" (rising time), respectively. The response time interval between the 10% and 90% of amplitudes. Refer to figure as below.

Note 6. Definition of contrast ratio:

Contrast ratio is calculated with the following formula.

$$\text{Contrast ratio (CR)} = \frac{\text{Brightness on the "white" state}}{\text{Brightness on the "black" state}}$$

Note 7: Driving conditions for CCFL:  $I_L = 6.5 \text{ mA}$ , 52KHz Frequency.

Note 8: Definition of viewing angle:

Note 9: Definition of white uniformity:

White uniformity is calculated with the following formula.

Luminance are measured at the following nine points (1~9).

$$\delta_w = \frac{\text{Minimum Brightness of 9 points}}{\text{Maximum Brightness of 9 points}}$$

#### D. Reliability test items (Note 1)

Mechanical shock (non-operation)	50G/11ms, 200G/2ms, ±X, ±Y, ±Z once for each direction	Note 1, 2, 3

Note 1: Evaluation should be tested after storage at room temperature for one hour.

Note 2: There should be no change which might affect the practical display function when the display quality test is conducted under normal operating condition.

Note 3: Judgment: Function OK.

#### E. Display quality

The display quality of the color TFT-LCD module should be in compliance with the AUO's OQC inspection standard.

#### F. Handling precaution

The Handling of the TFT-LCD should be in compliance with the AUO's handling principle standard.

**G. Packing:**  
**Label Sample**

**Green Mark Description:**

For Pb Free products, AUO will add  for identification.

For RoHS compatible products, AUO will add  for identification.

**Note.** The Green Mark will be present only when the green documents have been ready by AUO Internal Green Team. (The definition of green design follows the AUO green design checklist.)
